

will be engineering, the same that he studied at Chemawa. He will have a laboratory in which he will spend all his spare time. His inventions of a gasolineless engine for automobiles insures a comfortable competence as long as he lives, but he works harder than ever on his hobby, perpetual motion. Incidentally, he invents an egg-beater that is run by electricity. He does not build a house to live in, for he has never cared for girls and could never be reconciled to buying a new dress every change of the season. He will live in his laboratory with a clock for a companion until, seized with a longing for adventure, he will go to plant the Stars and Stripes at the South Pole and will never be seen nor heard of again.

Some brothers are alike in appearance and manner. The boy of whom I now tell you is a brother to the warrior before mentioned, but he is wholly unlike his illustrious kinsmen. He is slighter of stature and quieter of manner, and his aversion to fighting is so great that he would not even swat a fly. He has a hidden treasure somewhere, and as soon as he leaves school he will dig it up and travel in unexplored lands. His hair-breadth escapes will fill a book as big as an unabridged dictionary, but I shall not give his career in detail. When he reaches China he will stop and become a leader in the civilization of the Chinese. He will spend the rest of his life teaching the natives the ways of the white man and the Indian.

The next is the artist of our class. His high brow, his refined behavior, speak eloquently of good breeding and account for his love for the beautiful. Music and cartooning are his specialties, but it is in the composition and execution of exquisite music that he will excel. After a few more years of study, he will establish his studio in a thriving town of Alaska where he will spend a long and useful life teaching the youth of his native land to appreciate and to give expression to the beautiful.

The most talented girl of the class is of fair complexion with dark wavy hair. Her figure is slight and just the right proportion for wearing the present fashion of dress becomingly. She knows how to take a joke and how to make one. She has been in Chemawa since she was a small child, but she will soon leave for York State where her first benevolent act will be to secure an endowment for a library for poor ambitious young people. She is a good suffragette and will take a prominent part in politics of the state. Hers will be the honor of being the first woman mayor of New York City. She will be influential in ridding the state government of corruption. She will be as noted in her way as Jane Adams or Clara Barton are in theirs.

It is a proud class that can send forth at least one good cook. When we hear the word "cook" we immediately form a mental picture of a big
