A "HAYRACK" loading boom in extremely rough country high on the shoulders of Mt. Scott, in the logging woods of the Roseburg Lumber company.

The spar from which this boom swings is about 160 feet high and is rigged with a maze of heavy cables, some of which rigidly support it, while others operate the boom and still another running from the drum of a powerful Cummings yarder has a maximum length of 900 feet, and it "snakes" logs through up and over obstructions which would prove insurmountable to other methods of yarding.

High lead logging furnishes one of the most inspiring sights in the woods. The cable on the yarder drum used at this landing has a maximum length of 900 feet, and it "snakes" logs through up and over obstructions which would prove insurmountable to other methods of yarding.

The boom shown above differs from a heel boom in that it grips the log with two sets of tongs, spaced so that the log receives a direct lift. In this type of boom the entire weight of the log is cable-suspended, thus allowing the use of a weighing scale.
