ONCE IN A WHILE WE HAVE TO GET TECHNICAL...

Once in awhile we have to get technical because when we make startling statements, we should substantiate them. That's why we have to get a little technical in order to back up what we say—to point out facts every watch purchaser should know.

- Here are the statements:
1. A fifteen jewel watch is often a better watch than one having seventeen jewels.
  2. Most twenty-one jewel watches have TOO MANY jewels.

The odd-looking illustration above is a partial cut-away drawing of one end of a balance staff or shaft drawn highly magnified. The staff is seen to pass through one disc and butt up against another. These discs are ruby jewels which serve as bearings in a watch.

At the right of the staff between the jewels is a bubble of oil. It is perfectly obvious that the bubble of oil, if it is to do any good, should be in the center so that the shaft will turn in oil. The oil will not stay in the center of the jewel because it is never possible to get the two flat opposing jewel surfaces EXACTLY parallel to each other. Hence the oil runs to the thinnest space, forced there by CAPILLARY ATTRACTION, the same force that causes ink to run to the point of a pen.

When this watch arrived in the U. S. from Switzerland, it did not have the cap jewels. Over the center of each single jewel a bubble of oil clung in the correct place to effectively lubricate the watch. But, the American watch importer who is wise to the American demand for highly jeweled watches, adds the cap jewels. This watch will now sell more easily and for a higher price, but it will never keep accurate time because it can never be completely oiled.

More than 35 percent of the best known and most highly advertised watches for sale in jewelry stores today are up-jeweled in this or a similar manner.

It is our policy to assist our customers by giving them honest, sincere advice in the choice of a watch. If it is honest counsel you want when you buy a watch come in and talk to us.
