Mr. and Mrs. Parley Car of Lookingglass will hold open house at their home Oct. 25, between 7:30 and 9:30 p.m. in honor of their silver wedding anniversary. Neighbors and friends are invited to call.

Art Subert has returned to his work here, following a hospital stay. He is now working at the National Academy of Sciences.

Molecules May Be Secret To Fountain Of Youth

By JOSEPH L. MYLER
WASHINGTON (UPI)—Scientists working with molecules deduced only by liver cells. They have intervened so deeply in the makeup of paramecia, microscopic one-celled animals, as to create monstrous creatures with two mouths and three vents for waste.

This hope was held out today by Dr. T.M. Sonneborn of Indiana University in an address to scientists celebrating the centennial of the National Academy of Sciences.

cells, for example, to manufacture products normally produced only by liver cells. They have intervened so deeply in the makeup of paramecia, microscopic one-celled animals, as to create monstrous creatures with two mouths and three vents for waste.

Long-Time Puzzle
Science has long been puzzled by what makes one cell function differently from another. Already researchers have been doing and turn to other egg which proceeds by cell division. They have set tumor vision to produce more than a

million billion other cells, the building blocks of the body. The first cells, Sonneborn said, seem to be identical. Then differences appear. Finally, the body is possessed of scores of differently functioning cells hereditarily and function. RNA is the genetic material charged with carrying out DNA's orders.

How Does It Happen?
This is known as cell differentiation, and for a long time scientists held no hope of ever understanding it. In the past two decades there has been a "revolution" in this field of study, and a growing conviction that the area of one of skin tissue, say, and the other projects. They have set tumor vision to produce more than a

Scientists now believe that this cell differentiation comes from regulation—the turning on and off — of activity by the genes in which the boss molecules are situated. They are being forced the treated cell to take on a new occupation. The change is permanent, the injected cell passing its new pattern of activity on through subsequent generations.
