**SENIORS CHOOSE VITAL
SUBJECTS FOR THESE**

Seven Engineers Pick Interesting Experiments as Requisites for Graduation

A large number of Oregon engineering students have chosen subjects for their theses which are of wide interest to engineers, and which deal with some of the great practical problems of the day.

J. L. Johnson is working out a series of experiments on the upward pressure of water on the base of a dam built on a sand foundation. Where dams can not be built on rock, they are not always satisfactory, and the problem of building such dams has not yet been solved.

Bob Kellogg and Sid Henderson are engaged in experiments on the density of concrete to determine what proportions of stone and sand will give the most dense concrete. A number of specimens are now ready to be tested by compression, which will be done as soon as the necessary apparatus can be obtained.

J. V. Rast and C. R. Oleson are studying the problem of waterproofing concrete by means of crude oil mixed in with the concrete, taking into account the effect of the oil on the strength of the concrete.

Harry Devereaux is experimenting on the quality of a large number of building sands obtained from different parts of the state, to determine their comparative value. They have analyzed the sand chemically to see if the chemical properties have any appreciable effect upon the strength of the sand.

Ed. Himes is trying out the relative value of reinforced concrete sewer pipe and the ordinary vitrified clay pipe.

It is expected that the majority of these theses will be completed within the next month.
