

Kesey . . . EWEB . . .

(Continued from Page 7)

he says. "All I can do is lose something, because you can't match those kinds of successes." Do you think the critics will pounce on "Garage Sale"? "They're bound to do that with "Garage Sale," although there's not much there for them to pounce on. By the nature of a garage sale you're not saying you're Tiffany's."

His audience, he says, will grow smaller as he talks to people who understand him and what he is trying to say. "If I'm lucky and I can keep on top of it, I will be able to function as a citizen who has a vision, cause everyone has a vision, you know . . . But then . . . when it comes down to being the man that can do what needs to be done to perpetuate that vision, we fall apart. I think of it like this, I think of it as John Wayne and Dustin Hoffman. John Wayne is getting old, Dustin Hoffman is fast and smart. He can run things if John Wayne will let him. John Wayne finally gets to a point where he is old and wants to lay back, says 'Allright! Long haired fruit. You go ahead and see what you can do.' Dustin Hoffman gets a hold of it and falls apart, completely. John Wayne steps up and says, 'Allright!! I'll have to take it back over again and run this thing.' What he don't know is that he not only has to turn it over to Dustin Hoffman, but he has to support Dustin Hoffman while he does it. That is the battle that's going on inside most of us. That, and there's a third party that we haven't quite recognized yet, I don't know who plays him, John Carradine maybe."

Outside, the sun is dying a quick death. Kesey decides it's time to feed the cows. Walks out to the shed for hay, wheelbarrels it down along the fence, past the dozen or so cows and bulls (who say moooooo!). Dumps the hay, opens the fence: Out! Out! Get your hay! Watches his son Sean run the bulls out, slop! slop! in the mud. I begin to lose Kesey now: his eyes are on his son, on the bulls, on the skies of Oregon. Back down the fence to the barn, and I lose him some more . . . Say goodbye, shake hands and smile . . . I'm fading from his sight, fading out fast . . .

Continued from Page 1

"The best fuel loading date is now indicated to start in October 1974, and commercial operation in July 1975, compared with former estimates of March 1974 and September 1974, respectively."

In addition, the cost of the project has been raised to \$298 million, \$44 million above the previous estimate. "Of this total," Peterson said "the amount to be shared with EWEB is \$247 million," an increase in the shared amount of \$28 million. Since EWEB owns 30 per cent of the plant, the total increase to the utility will be approximately \$8.4 million.

Peterson, however, didn't feel that the extended dates and costs would be a total loss. "This delay is going to make possible the consideration of a new core that is being developed by Westinghouse. This would not have been possible had the original schedule been met," he told the board. "It seems to make good sense to go ahead and make plans for the new unit at this time. The new core would generate higher power at a lower temperature and therefore be safer to operate."

Peterson went on to say that the core originally planned would meet with the existing AEC requirements, but the commission has recently held a year of hearings and the safety requirements are likely to be changed.

The presentation on wind power was given by E. Wendell Hewson, a Professor at Oregon State University, at the request of EWEB General Manager Byron Price.

Hewson, along with three other OSU professors and several graduate students, is presently involved in a study to determine if wind "is a feasible source of power on the coast."

Hewson named two major kinds of wind power generators, land based and water based. "The possibility exists for water based generators off the coast," he said. "But they would be very expensive and would involve major engineering tasks, without mentioning the transmission of power." The water based generators need 250 to 275 feet of water.

Hewson didn't say definitely how feasible land based generators the coast would be, but did say that in many places the wind was more than adequate to create power.

At the conclusion of his presentation, Hewson told the board "we will be making several proposals to the federal government in the coming year. These proposals required much engineering time and know how. We have found that the more local support we have, the better off we are when approaching the government."

Reynolds then proposed that \$25,000 be given to the research group.

Board chairman John Tiffany pointed out that EWEB is "now embarked on geo-thermal and solid waste disposal research projects. This is not to say that wind as a resource doesn't need research, just that we have our priorities."

Reynolds reminded the board that \$50,000 had already been "earmarked" in this year's budget for "solar, wind, etc." research.

Reynolds asked the board to make a decision in the near future as to whether to \$50,000 would be given to EPRI or a local project. "It seems," he said "that we have a local Oregon project that is deserving of some of our money."
