 Continued from Page 5

Starting at the other forward position will likely be sophomore Clyde Jordan. Jordan is the only other Duck who got extensive playing time last year when he averaged 3 points and 2.5 rebounds a game.

Jordan's biggest asset to the team may be his defensive skills. Last year, Mixon was assigned the task of guarding the opponent's big scorer, and this year, Jordan will most likely fill that role.

Replacing Brandon and Mixon could be the most difficult goal the team will have to accomplish this year. Redshirt freshman Orlando Williams and junior college transfer Andre Collier will likely be backcourt starters, at least at the beginning of the season.

Williams, who was the Oregon high school player of the year two years ago, practiced with the team all last year and knows the offense. He is a good, pure shooter with good strength for a guard, Monson said.

Collier is in the unenviable position of following in the footsteps of Brandon, who averaged 26 points a game and was voted Pac-10 Player of the Year last season.

Collier averaged 20 points and eight assists a game last year for DeAnza College in California, and although Monson likes Collier's ability to run an offense, he is realistic about Collier's abilities.

"Collier will not be able to take the place of Brandon, but he will score points for us," Monson said. "He's played in college, so he knows how to run an offense."

The guard situation could change later on down the road as freshman Johnnie Reece and sophomore Antoine Stoudamire could challenge for playing time.

Reece was last year's player of the year in Colorado where he averaged 35 points, eight assists, seven rebounds and four steals a game during his senior year.

Stoudamire, a transfer from Georgetown last year, will be eligible to play in mid-December. Stoudamire, who will most likely compete for time at the off-guard position, is from Portland's Jesuit High School where he led the state with 24 points and 14 rebounds a game in his senior year.

The center position could be the toughest for the Ducks to fill. Starting at the position will be senior Chuck Patterson, who played sparingly last year.

He is the only starter over 6-7, which could be a rebounding problem, especially with Lucas gone.

As for the remaining players, Monson is impressed with 6-9 freshman Jeff Potter.

"He's an aggressive kid," Monson said.

Also suiting up for the Ducks this year will be sophomore forwards Matt O'Neil and Eric van der Veen, and freshman forwards Kevin Robinson and Damon Runyon.

This will be an interesting year for the Ducks, and Monson is curious to see what will happen.

"We need time under game conditions," he said. "We have a young team and a lot of enthusiasm. It's hard to tell what these kids will do when they get on Mac Court."

**ALL FINANCIAL INSTITUTIONS...  
 ARE NOT CREATED EQUAL**

If you believe that all financial institutions are the same, perhaps you have not looked into your Credit Union. At U-Lane-O, business is not conducted as usual. We offer a unique approach to financial services. As a cooperative, members have equal vote and say in the management of the Credit Union. The result is an affordable and responsible way of providing financial services.

While financial institutions are not created equal, we happen to believe that all members are. Come visit U-Lane-O and let us show you the Credit Union way of doing business.

Serving U of O students and employees.

**JOSEPH CONE**  
 WILL BE SIGNING HIS NEW BOOK.

**FIRE UNDER THE SEA**  
 The Discovery of the Most Extraordinary Environment on Earth — Volcanic Springs on the ocean floor.

**AT THE UO BOOKSTORE**  
 General Book Dept., 2nd Floor  
**Friday, Nov. 8**  
**12:30-1:30**

Cone lures readers into his exciting account of the recent and momentous discovery of seafloor vents by comparing it to a detective story. The riddles to be solved are the very essence of science: "How is the earth put together?" and "How and where did life begin?"

Cone plots the course of the inspirations, revolutionary theories, controversies, breakthroughs, and proofs that led scientists to the seafloor's hot springs and an understanding of the forces that create them.

This is a tale of serendipity, politics, and greed, involving a cast of brilliant and courageous thinkers, explorers, and inventors of incredibly sophisticated equipment. It is also a testament to some astonishing natural phenomena: as seawater circulates through the seafloor, it's heated to temperatures exceeding 660 degrees Fahrenheit; it then gushes out into the cold, dark ocean, building towers of minerals and sustaining remarkable, improbable, and previously unknown life-forms nurtured by chemosynthesis.

Joseph Cone is a graduate of Yale University, and the University of Oregon. He currently lives in Eugene, and teaches at Oregon State University.
