

# The Isthmian THEATRE

"The Spirit of the Light"..... Vitagraph  
A love story of an artist and the daughter of a light house keeper. It is beautifully portrayed and the photography is just magnificent.

"Harnessing the Ocean". A comprehensive series of moving photos showing the complete workings of the Atlantic City ocean wave motor generating 7,500 horse power. The only one of its kind in the world.

"The Two Heroes"..... Edison  
Friend Bumpkins is an old civil war hero, claiming great heroic deeds to himself. The climax is great. It will please everybody.

"The Rescue of the Abernathy Kids"..... Pathe  
This is a wonderful picture. The kids are actually rescued by real bloodhounds from real businesslike wolves. There is no "fake" about this. They are real live wolves and they come come pretty near getting the kids but the hounds score the first and every round after they once start in.

Right in your busiest season when you have the least time to spare you are most likely to take diarrhoea and lose several days' time, unless you have Chamberlain's Colic, Cholera and Diarrhoea Remedy at hand and take a dose on the first appearance of the disease. For sale by all dealers.

Oscar Jackson is again able to be at his work in the Snodgrass grocery after being forced to rest a day or two after meeting with considerable injury to his arm by being cut in the meat slasher at the store.

## JURY IS TO GET CASE TONIGHT

TWO BOUND OVER TO GRAND JURY YESTERDAY.

Golden and Godsey Are Principals in Next Case to Come Up.

C. E. Golden against S. P. Godsey, involving a minor question, is set as the next case to come up in circuit court. The jury will likely get the final arguments and instructions late this afternoon in the Grande Ronde Cash company's case, commenced yesterday morning.

**Work for Grand Jury.**  
Joe Banterey and E. C. Henry waived examinations yesterday before Justice Williams on charges of burglary and were bound over to the grand jury on \$500 bonds each.

These two men are accused of having stolen some tools from W. W. Crawford.

**Muscles May Move Themselves.**  
Albert von Haller, a Swiss surgeon of the eighteenth century, was the first to point out that the muscles of our bodies have an automatic action. Before Haller's time it was believed that the muscles could not contract or swell up of themselves, but were drawn up by the nerves of volition. Haller discovered that this is not so, but that a muscle, if irritated, will draw itself together automatically, even when it is quite separated from the nerves, and this has since been proved to be true by a great number of experiments. So that, though it is true our nerves are the cause of our moving, because they excite the muscles and so cause them to contract, yet the real power of contraction is in the muscle itself. The body of man is full of wonders, not the least of which is this automatic power of contraction in all muscles. — Louisville Courier-Journal.

## ARTIFICIAL EYES.

The Art of Making Them Resemble Their Human Patterns.

MATCH IN SHAPE AND COLOR.

They Fit the Eye Socket Perfectly and May Even Be Worn During Sleeping Hours—Made of Glass, For Which No Substitute Has Yet Been Found.

Germany leads all other countries in the manufacture of artificial eyes. The American consul general at Coburg relates that probably ever since the beginning of the world civilized people have endeavored to hide or remedy any flaw in their appearance, such as the loss of an eye would cause. How this was done by the various nations it is hard to say. Up to the present time no discoveries have been made that would offer enlightenment on this subject. There are, it is true, a few unauthenticated accounts as far back as the middle ages, but the first reliable report is given by the French surgeon Ambrose Pare in 1500.

Two kinds of artificial eyes were known to him, the ekblepharos and the hypoblepharos. The ekblepharos was made by painting the eye and all surrounding parts as far as the brows on a plate, which was placed in front of the eye socket and held in position by a string tied over the head. The hypoblepharos was used in a manner similar to that of today, being put behind the eyelid, in the eye socket itself, and was composed of a metal shell of copper, silver or gold, covered with enamel and glass fusions.

It was only at the close of the eighteenth century that these artificial eyes really became of practical use, it being then found possible to do away with the metal shell altogether and employ enamel and glass. The material used was a soft lead glass, easily shaped, but also easily destructible, and an eye had to be renewed every three or four months to prevent the socket from becoming affected.

It is known that in the middle of the nineteenth century eyes were made by enamellers in Dresden, Prague, London and Stockholm, and in Thuringia. The Thuringian makers were not enamellers, but glassblowers working in connection with the porcelain painting industry, whose endless and untiring experiment resulted in the discovery of an ideal material, cryolite glass, the use of which led to a new technique in eye manufacture. Moreover, there can now be produced all the characteristics of the human eye which had been possible in enamel work. The new prosthetic eye received the name "reform eye." To be of value, however, it must be made to exactly fit the eye socket.

Today it is possible to give to the reform eye any form and color desired, and in most cases it can be even worn at night, thereby preventing the lid from sinking into the socket and the lashes from sticking together. At times attempts have been made to replace the breakable glass by vulcanite or celluloid, but such efforts have long since been given up as useless.

In 1852 the method used in France for making eyes was as follows: On the broadly pressed end of a small, colorless, transparent rod of enamel the pupil was first made, and the iris was then formed on this by means of a small, thin pointed, colored enameled rod, the designing of the iris being made possible by melting the point of this rod.

In Paris the good eyes are now so made. A glass tube, closed at one end and of the color of the sclerotic, is next blown into the form of an oval, and in the middle of this a hole is melted, the edges of which are rounded off evenly and pressed a little outward. The iris is then placed in this opening and well melted in. A thick coating of glass remains behind. The eye is rounded off, the projecting rim of the white coat is smoothed with a metal rod, and this coat is thereby joined to the sclerotic. By means of a thin, pointed red rod the blood vessels to be seen on the hard coat of the human eye are then melted in. The superfluous back part of the eyeball is melted off, thereby giving to the eye the desired form. The eye is finally placed on hot sand, where it becomes gradually cooled off.

Glass eyes are made in quite a different manner in Lauscha, the center of this industry in Germany, where their manufacture is altogether a house industry. The eyes are usually made by one member of a family, and the art is handed down from one generation to another. A gas flame is used for melting the glass. A small drop of white glass is put on the white blown ball from which the sclerotic is to be made and is then blown so as to make a circle about eight millimeters (0.315 inch) in diameter. On this circle the structure of the iris is built by means of variously colored glass rods. A drop of black glass makes the pupil. Over the finished iris crystal glass is melted in order to imitate the cornea. The further manufacture is similar to that given in the first description.
