DIAMOND BRIQUET

Diamond Briquets are made from the purest, richest portions of coal veins that have made the Pacific Coast Coal Company famous. The coal is ground fine, dried thoroughly and then mixed with the purest of asphalt—asphalt with all the light, smelly oils burned off.

This rich, soft mass then goes through massive presses that give it the tremendous pressure of almost 5000 pounds to the square inch. It emerges in briquets of cylindrical shape with rounded ends, each weighing 10 1-2 ounces, and each stamped with a diamond.

Diamond Briquets have a heating value of 13,432 British Thermal Units to the pound and extended tests prove them conclusively to be fully 10 per cent better than the best house coal now on the market, with only eight and a fraction per cent ash.

What the United States Bureau of Mines Says About Briquets

1. The even size of Briquets permits a more regular and thorough combustion in the firebox or furnace.

2. Briquets produce much less smoke and in many cases practically no smoke.

3. They retain their shape in the fire and do not coke sufficiently to cut off the needed supply of air.

4. They burn to a fine ash without clinkering. Clinkers can be formed if all the absolute ash is not removed from the grates regularly.

5. A Briquet fire requires much less care than one of raw fuel. Suggestions for Getting Best Results from DIAMOND BRIQUETS

Clean out firebox thoroughly when you commence using Briquets. Use more kindling than used for lump coal. This will also aid in keeping chimney clean.

Give the fire full draft until well started. This burns the smoke and while making more heat also prevents soot.

Check the draft after fire is well started; very little draft is needed then, and fuel consumption will be reduced.

When adding more Briquets increase the chimney draft while stove or furnace is open. This will prevent smoke from escaping into the room.

A gentle shaking will clean the grates.

If you have a strong draft carry some Briquet ashes on the grates to help regulate the fire. Briquet ashes are light and porous and the draft can work through.

For banking or to hold over night, cut off all drafts completely after applying the Briquets. If you wish to bank fires every night, you will get the best results by carrying a deep fire, leaving ashes on the grate.

How Is Your Milk Handled?

(News Story Published in Portland Oregonian)

Sweeping changes in milk conditions in Portland are outlined in a proposed new ordinance which has been drafted by the milk inspection division of the City Health Bureau and which probably will be submitted to the City Council within a few days. The changes, if adopted by the Council, will force all small dairies, including those having one and two cows, to comply with the sanitary requirements imposed on larger dairies.

The measure is considered one of the most important from a health standpoint of any proposed since milk inspection was established in Portland six years ago.

At present one and two-cow dairies are not classed as dairies, and therefore are not subject to sanitary restrictions of the present milk and dairy ordinance. Investigations concluded recently have revealed the fact that milk sold by these small dairies is in many instances impure and unfit for consumption. Cases have been found where the cows are diseased and the milk is handled and bottled under extremely insanitary conditions.

All Cows to Be Tested.

The new ordinance is aimed to require these dairies to submit their

cows for tuberculin test by the veterinarians for the milk inspection bureau, to handle the milk in a sanitary manner and either to install regulation sterilizers for bottles and other utensils or to make deliveries only in sanitary cartons which are used only once.

With the large milk plants a number now ship milk in from the farms and bottle it in its raw state, thus subjecting the product to handling on the farm, on the trains and again at the milk plants. In many cases the milk is 24 hours old before it reaches the consumer. The new ordinance would require that this milk shall be bottled for the consumer on the farm or shall be pasteurized (boiled) on reaching the milk plant.

All dairies except those of a few cows are to be required to install the sterilization equipment for the cleansing of bottles, pails and other utensils. Practically all of them have this equipment at present. The small dealer, whose business is delivery of milk to a few customers, in some cases only one or two, the ordinance will give the option of putting in the sterilizers or delivering in wax-paper cartons, which are destroyed after the milk

has been taken out. These small dairies must submit their cows for tuberculin test.

Necessity Is Cited.

Dr. D. W. Mack, of the milk inspection bureau, says he expects a great deal of opposition to the ordinance because of its requirements, but he believes it is a measure that should go through. "We have watched this situation for years," said Dr. Mack yesterday. "We have studied it from all angles and are convinced through actual demonstration that it is a necessary and an important health move. The conditions in these one and two-cow dairies are bad in a great many cases and should be corrected for the protection of the health of patrons who may not realize the danger.

"As an example we recently forced a small dealer to let us test a cow which was a part of his small dairy. We could see that the animal was suffering from an advanced state of tuberculosis. This cow was tested and condemned, and the carcass was so full of tuberculosis that it had to be destroyed at a slaughter yard. Yet milk was being sold from this cow. This is only one of many cases."
