QUALITY OF HEN FLOCK VASTLY IMPROVED BY USING TRAP NEST

Three-Compartment Trap Nest Is Not Difficult to Make.

(Prepared by the United States Department of Agriculture.)

The most prepossessing hen is not always the most industrious layer. She may be the loquacious chatter, but if her owner uses trap nests she cannot fool him. He can check up on results. The trap nest is so arranged that when the hen enters she is confined until released by the attendant. Specialists of the United States Department of Agriculture say that trap nests may be used to advantage by the best breeders of hens. It adds mechanical precision to judgment and experience in developing the flock and maintaining it at a high standard of egg production. It tames the birds and tends to stimulate laying. It furnishes definite knowledge of the traits and habits

Details of Construction of Trap Nest.

its of each hen. It furnishes the most satisfactory basis for breeding, and it eliminates the nonproductive hen.

Careful Observation Needed.

In flocks of 50 or more, a three-compartment trap nest should be provided for every ten hens. In smaller flocks, a slightly larger proportion of nests is needed. Numbered bands are placed on the legs of the hens and a record is kept of their egg production. Frequent visits to the nests are necessary, especially when the hens are laying freely and during warm weather. There should never be less than three visits a day, and four or five would be better.

The trap nest may be placed on the walls of the pen or attached to the underside of the dropping board. If the latter course is taken, the front of the nest should face the pen. The rear may be made of wire to allow good ventilation. The dropping board will

serve as a top. If the nest is placed on the wall, slats or wire at a sharp angle should extend from the front of the nest to the wall to prevent hens from roosting on the top.

The trap nest is so constructed that, when the hen enters, her back raises the door. This releases the catch or trigger and allows the door to close. The catch, regulated by a screw or nail at the lower inside edge, should be set so that it just holds the door. It should have a washer on the screw to prevent sticking, and a guard to keep away the nesting material. A variation may be made for large or small hens by shortening or lengthening the catch which supports the door or by adjusting the size of the triangular notch in the door itself.

The following directions are given by the department's poultry specialists for constructing a three-compartment trap nest:

Cut four 7 1/2-inch boards for ends and partitions, 12 inches wide by 19 inches long; enough 3/4-inch boards, 3 3/4 inches long, laid lengthwise, to cover the top, back and bottom; and one strip, 3 3/4 inches long and 1 1/2 inches wide, for the front of the nest. Cut three pieces of 1/2-inch boards, 12 inches long and 8 inches high, to hold the nesting material away from the door.

Nail the top, back and bottom to the ends and partitions, insert the 3-inch strips in the nests, and make the guard, nailing it to the left side of the nest. Bore a hole in the catch large enough that the catch will move freely when screwed into position on the side. Place a washer on the screw between the catch and the side of the nest. Insert a screw at the lower edge of the catch to stop it when set, so that the catch will just hold the door.

Build Seven-Eighths-Inch Doors. Make the doors of 7/8-inch material, 12 inches by 6 inches, and cut a triangular notch in the center, 4 inches wide at the bottom. Put two screw eyes in the top of the doors and bore holes in the front of the nests, 2 inches below the top (inside measurement), through which a 3/16-inch wire is run to support the doors.

Attach to the front of the nests a narrow strip upon which the hens can jump. Place a button or block of wood on the front of each partition to hold the door when the nest is closed.

If the nests are to be placed directly below the dropping board, a wire top should be used with a 5-inch strip of wood on the front edge of the top to stiffen them.

WINTER SHELTER FOR DUCKS

Breeding Fowls Must Be Furnished With Some Protection Against Cold Rains and Snow.

Although adult ducks are so well protected by their feathers that they can stand a great deal of dry cold weather, the breeding birds must be furnished protection from the cold winter rains and snows and they must have a dry floor on which to roost. Therefore a suitable shed or building should be made available for the fowls before the coming of winter. The building may be quite simple in construction and much less expensive than one for hens.

BLACKHEAD IS MOST DEADLY

Cases of Infection Are Few Where Turkeys Are Given Free Range at All Seasons.

Of the infectious diseases of turkeys, blackhead is the most destructive. It is notable that whenever the climate and range conditions are such as to permit of the turkeys foraging for most of their feed from the time they are hatched until they are marketed, cases of blackhead are infrequent. No positive cure for blackhead has been found, but free range and care not to overfeed are very important factors in raising turkeys successfully.

COWPEA HAY BEST FOR COWS

Crop Has but Little Standing in City Markets on Account of Difficulty in Curing.

Cowpea hay is sold by specialists of the United States Department of Agriculture to be better suited for feeding to cows than to horses. Partly on this account and partly because of the difficulty often experienced in properly curing the large growth of succulent vines and its consequent and unevenness in quality, cowpea hay has but little standing in the city markets.

Though He's Probably Forgotten, After a man captures a man, and leads him away from the water, she spends the rest of her life trying to find out the name of the first girl he kissed.—Toledo Blade.

EXCELLENT FEED FOR SHEEP

Silage Made From Corn on Which Grain Is Just Beginning to Harden Is First-Class.

Finely cut silage, made from corn on which the grain is beginning to harden, is first-class sheep feed, and may be fed in limited quantities with the best of success. About a pound and a half to three pounds daily to a ewe weighing around 150 pounds will supply about the correct amount of silage. At no time should you attempt to feed silage spoiled in the least, or of inferior quality.

SOY BEANS RANK VERY HIGH

Practical Value as Forage and Grain Warrants Much Greater Use, Says Ohio Station.

Soy beans rank very high in feeding value. According to the Ohio station 20 bushels of soy beans will carry 40 per cent more protein and 25 per cent more fat than 50 bushels of corn, or 30 per cent more protein and 65 per cent more fat than two tons of clover hay. The practical value of soy beans forage as well as grain warrants a much greater use of the crop.

ALLEGED SLAYERS

(Continued from Page 1)

stated that just before the shooting a remark to the effect that "you can't get your ring" and a threat against the life of the party addressed was heard. Then three shots were fired and, shortly after, another.

The prosecution intends to prove that two guns were used and that it was not possible to fire all the shots from one gun and also that the shooting was not done at short range, showing that there was no struggle.

In closing, Mr. Ivanhoe characterized the crime as "deliberate, pre-meditated murder, for the purpose of settling a debt."

In his statement for the defense R. J. Kitchen, attorney for Mrs. Jones and Chin Bill, agreed to certain portions of the evidence the prosecution asserted it would prove but took exception to many particulars.

Mr. Kitchen denied that Sheu came here to look for his property and stated that the defense would prove that he came here because of his alleged infatuation for Mrs. Jones. He asserted that Mrs. Jones left Portland to get rid of Sheu who had attempted to force his attentions on her.

and that it would be proved that the information of Mrs. Jones' whereabouts was obtained not through Chin-bill at The Dalles as had been alleged by the prosecution, but through the father and sister of Mrs. Jones.

According to the testimony Mr. Kitchen expects to present Sheu made threat after threat to take the life of Mrs. Jones if she did not leave her legitimate husband for him. The defense also asserted that Sheu was known as a gunman in Portland.

On the fatal day Mrs. Jones tried to keep the two Chinese apart after threats had been made by Sheu against the life of Chin, according to the defense's version of the affair.

In discussing the ring which is

alleged to have been the property of the deceased by the prosecution, defense will, according to Mr. Kitchen, attempt to establish that the ring was given to Mrs. Jones' husband.

The defense will also attempt to establish that the shooting was at close range and that a struggle preceded the shooting.

The jury was selected as follows: J. A. McKenzie, Walter E. Pratt, G. Klopfenstein, Arrie Rydman, J. A. Gaskill, F. E. Greiner, J. C. Ginger, C. H. Blystone, Wm. Hansen, J. D. Oliver, C. J. Eaton and Jake Dellaga.
