**Flowers Signboards.**  
In China, so the tourists tell us, one sees exceedingly flowery signs upon the shops. If one can read them. In fact, this may be why the republic was once called the Flower Kingdom. Here, for instance, are some of those seen in Peking: "Mutton Shop of Morning Twilight," "The Ten Virtues All Complete," "The Shop of Heaven-Sent Luck," "The Nine Felicitous Prolonged" and "The Tea-Shop of Celestial Principles."

**Too Much Meat Hurts Kidneys**  
Take a glass of Satts to Flush Kidneys if Bladder bothers you.

Eating too much meat may produce kidney trouble in some form or other, says a well-known authority, because the uric acid excites the kidneys. They become overworked, get sluggish, clog up, and cause all sorts of distress, particularly backache and misery in the kidney region; rheumatic twinges, severe headaches, acid stomach, constipation, torpid liver, sleeplessness, bladder and urinary irritation.

The moment your back hurts or kidneys aren't acting right, or if bladder bothers you, get about four ounces of Jad Salts from any grocery store; take a tablespoonful in a glass of water before breakfast for a few days, and your kidneys may then act fine.

This famous salt is made from the acid of grapes and lemon juice, combined with lithia, and has been used for generations to flush clogged kidneys and stimulate them to normal activity; also to neutralize the acids in the urine so that it no longer irritates, thus often ending bladder disorders.

Jad Salts can not injure any one; make a delightful effervescent lithia water drink which millions of men and women take now and then to help keep the kidneys and urinary organs clean, thus often avoiding serious kidney disorders.

## LOSE 50 PER CENT OF POSSIBLE CORN CROP

Washington.—Of every 100 bushels of corn that farmers set out to grow, only 50 bushels are realized, according to figures compiled by the United States Department of Agriculture over a period of 13 years. The difference between the potential crop and the quantity harvested is due to weather conditions, defective seed, plant diseases and insect and animal pests. For every bushel of corn harvested, some 50 bushels of corn are left to rot in the field.

Were it not for the elements that tend to reduce the size of the crop, the average crop for the 13-year period would have been about 4,574,000,000 bushels, instead of the 2,287,000,000 bushels actually harvested, provided the same acreage had been planted.

The department points out, however, that if these elements did not exist and corn growers were certain of 100 per cent results, the corn acreage probably would have been greatly reduced, so that the final output might not have been a larger crop than that actually harvested. It would mean simply that the farmer could get from two acres the crop the now harvests from three.

The largest potential corn crop was one of about 5,000,000,000 bushels in 1917, although the actual harvest of 3,925,000,000 bushels in that year was exceeded in the three years 1912, 1920 and 1921, the largest harvest crop being 3,229,000,000 bushels in 1920.

A large crop of corn is due to a relatively low production of the many causes by which it is limited, but of course production is also limited to average, the department records show.

During the 13 years the lowest degree of production was 23.5 per cent of a potential crop in 1923, and the highest was 44.5 per cent in 1917. Within the period covered, from about one-fourth to nearly one-half of a potential production has failed to be realized. The average is a little more than one-third.

**ASTORIA TO ASK SUM**  
ASTORIA.—The legislature will be requested to increase the yearly appropriation for the John Jacob Astor experiment station from \$2,000 to \$5,000. It was decided at a meeting held here yesterday. James W. MacIntyre, representative of Astoria, introduced the resolution at the coming legislative session to provide for the desired appropriation.

A report submitted at the meeting showed that of the seven branch experiment stations in the state, Eastern Oregon has five, and that section of the state receives 68 per cent of the appropriation for the maintenance of experimental stations, while the coast counties have but one branch and receive only 8 1/2 per cent of the appropriation.
