Non-Detonating

Neither the most powerful powder nor the most powerful gasoline detonates

There are two kinds of gasoline just as there are two kinds of powder. One *detonates*—explodes with a single crash.

It pounds the piston down with a sledge hammer blow. Having a tendency to explode prematurely, it limits compression, decreasing power and efficiency. It often causes "knocking" on hills.

And the crashing blows, repeated, increase vibration—which means more wear and tear.

Detonating gasoline and dynamite are similar in that both *detonate*.

Even, Sustained Impulses

Union Gasoline is different. Like the smokeless powder, used in all big guns, it does *not detonate*.

Its explosions are progressive and prolonged. They *thrust* the piston down with a steady, sustained impulse, just as the big gun thrusts out the projectile.

These explosions permit higher compression, for compression is limited by the tendency of a gasoline to detonate, as all authorities know.

You enjoy more power and efficiency from a gasoline like this.

New Speed

This additional, *smoother* power in your motor means a new "lift" on hills, new speed on the level and more snap in the pickup.

These steady, sustained impulses decrease vibration, so save wear and tear. Detonating powder would be the ruination of big guns.

And this increased, all-round efficiency means greater fuel economy.

Thus Union *Non-Detonating* Gasoline is the fuel that gives you better service from your motor in several important ways.

Union is always uniform. It doesn't disintegrate, thus doesn't deteriorate in storage. You get all the power when you want it that is put into it at the Union plants.
