**STUDY THE GARDEN LINE**—Carefully planned flower gardens and borders of annuals often seem to lack something and fail to come up to the expectations of their owner and designer. In a great many cases the factor lacking and which is not apparent is diversity of height and variety of "sky line." A monotony of height in the various beds and colorings of flowers, particularly if they are all of fairly low growth, detracts greatly from the general effect and the reason for the lack of a completely satisfactory garden isn't apparent until this feature is considered.

In planting the flower garden this year, and particularly in the arrangement of a long border, study the arrangement so that there will be a fairly tall planting from time to time, or at least a group of three or four tall-growing annuals to break this monotony and give variety.

Some of the annuals best suited for this purpose and which grow easily and quickly from seed are the spider flower (Cleome punicea), the annual small-flowered sunflowers (Helianthus) combined with the large annual sunflowers of old-fashioned gardens; the star-flowered ornamental tobacco, Nicotiana glauca, not to be confused with the tall African marigolds; or the plummy celosia or cockscomb.

An occasional planting of some of these tall-growing annuals is needed to break up the uniformity of height of so many of the summer annuals which range around a foot and a half to two feet in height.

When beds of robust-growing annuals such as zinnias and African marigolds are planted, they should be arranged so that some plant of lower growth and suitable coloring will be adjoining to give this variety. The effect is much finer if this detail is watched closely in laying out the garden. Monotony of color is to be avoided if the most decorative value is to be secured from the planting.
