## Health Talks

**FOOD FOR TEETH**  
Animals in the wild state and primitive peoples unacquainted with the foodstuffs of civilization rarely suffer from tooth decay.

In fact, certain of the primitive tribes deformities of the teeth appear as a thing of beauty and they deliberately clip, file or otherwise misshape the teeth.

That the healthy condition of the teeth of primitive peoples and of wild animals is in part, at least, due to the foods they eat, has been experimentally demonstrated.

In England and America investigators have found it possible by means of controlled diets to produce good or bad teeth in experimental animals. By feeding animals on a diet poor in vitamins and calcium, but excessive in meats and sugars, they have been made to suffer dental disturbances similar to those found in man.

The young born to such animals also show an hereditary weakness in their teeth. Not only are the teeth of these young animals soft, but they are incompletely developed and misshapen, and their supporting tissues, that is gums and jaws, are weak.

Local mouth conditions in terms of acid saliva or the growth of acid-forming germs do not appear responsible for the damage seen in the mouths of these experimental animals. For, when the diet fed to these animals is improved through the addition of vegetables, fruits and milk, the mouth conditions of both females and young improve.

Mouth cleanliness is of course

most desirable, but diet is vital, particularly in the young. In the first months of life a sound or weak foundation for future mouth health may be laid down and whether it is to be one or the other is largely determined by diet.

This is one of the reasons why it is desirable that babies should be breast fed.
