Lumber Industry Again Squeezed

The "tight money" policy of the Federal Reserve system designed to combat inflation, has returned with a vengeance. Home loans, as a result, have seen another jump in interest rates.

This is the same policy which was followed in 1956 and 1957, when it looked like inflation was a danger.

Anyone then in the Pacific Northwest, too dependent upon lumber as a basic item of the economy, remembers what

happened. Lumber went through an economic wringer, and still has not returned to its 1955 price level. Recent downturns have

come again in the lumber market. (There is one consoling factor, this time. Prices may not drop as far, since inventories are not nearly so high as

they were at the start of the price drop of two years ago.)

With the government selling shortterm bonds at an interest rate of five per cent the government is, at the same time, competing with the mortgage market for money.

What's the net effect? Well, let's take an average new home,

selling for \$13,500.

Only a few short years ago, money was available at 41/2 per cent for purchase of this home with no discount. Over a 25 year loan, a borrower paid monthly pay-

ments of \$75.04, plus an amount suf-

ficient to cover taxes and insurance. He repaid the \$13,500, and paid an additional \$9,012 in interest charges.

Add taxes and insurance, and in most cases he paid well over twice the original

Now, interest rates generally are 61/2 per cent or more, and often carry discounts in addition. The discounts add another one per cent or so over the life of the loan.

But let's say a man is buying that same \$13,500 house, borrowing the money and paying an interest rate of 7

Now his monthly payments, exclusive of taxes and insurance, are \$95.43, an increase of \$20.39 per month.

Over the life of his loan, the interest costs alone have increased \$6,129. His total interest is \$15,141, more than his house cost to build.

Even figures like that don't bother many home buyers. They go ahead and buy, anyway,

But the higher interest rates, combined with a shortage of funds to support the mortgage market, puts a big halt in home construction.

The lumber industry does not remain very profitable when home construction drops below a rate of 1,250,00 per year. And when the business is not profitable, the inevitable result is a wholesale series of layoffs and shutdowns of less efficient operators.

At the same time, during the last wringout, other prices and wages kep advancing.

There must be some other method of controlling inflation, one which will not put the lumber and farm machinery business in serious financial trouble. The present system is OK for those areas of highly diversified big industry, but pretty rough on the Pacific Northwest.

Origin Of Moon Pictures May Reveal The world eagerly awaits some pic-

tures the Russians report they are now processing and will soon publish, Those pictures are the first ever tak-

en of the unknown side of the moon. The Tass news agency reports they were taken when Lunik III cruised around the moon earlier this month. Last Sunday Lunik III reportedly transmitted picture signals back to Moscow, as the satellite swung around the earth.

It can be taken for granted that the

picture-taking attempt was successful.

Otherwise Tass would not have announced this week that the picture had been received from the satellite and were be-

ing processed. What will the picture show? The backside of the moon has long been a mystery to earthlings, but astronomers guess that the unseen half of the earth's satellite will be much like

the side that has been visible for cons. Yet the Soviet picture may solve an age-old problem: What force caused

the craters in the moon? The theory of volcanic origin has support, but a more widely held supposition is that the rimmed calderas on the moon's surface were created when giant metcorntes crashed into the orb. There are several examples on the earth of the sole that can be made by a meteor: One

of these is the giant crater in Arizona. Still another suggestion is that the lunar craters were created by frozen heads of comets exploding against the moon. Many astronomers are inclining to the belief that comet heads are mainly frozen hydrocarbons with an admixture of unstable chemical compounds.

On Impast, such comet "war heads" would behave like a high explosive. Recently, two British scientists, Drs. A. C. Gaydon and R. C. M. Learner, speculated that huge bubbles of gas bursting through the moon's surface formed

These various theories do not exactly fit into conditions found on the moon by astronomers in their telescopic studies. Nor do astronomers agree on the origin of moon dust believed to mantle the lunar orb, possibly to a depth of threefourths of a mile. New come the Russians with a pro-

mise of pictures of the side of the moon never seen by human eyes. They may solve the mystery of the moon's pockbe wound inextricably with that of
