Seeing Stars by Day.

Although it is an old belief that the stars can be seen in daylight from the bottom of a deep mine, well, chimney or other shaft, the Rev. W. F. A. Ellison maintains that it has no foundation in fact. Writing in the Journal of the British Astronomical Association, Mr. Ellison says that the invisibility of the stars in the daytime is caused by the glare of the atmosphere illuminated by the rays of the sun and that there is no reason why a chimney or other shaft should sensibly diminish the glare. Even with a telescope the visibility of stars and planets in the daytime depends greatly upon their color. Red or yellow stars are much more easily seen than white ones, and the telescope must be very carefully focused or even a bright star will be invisible in the bright sky. The planets Venus and Mercury, on the other hand, can be seen better in daylight than in the dark, but most of the planets are less visible in daylight than the stars.

Plainsmen of Argentina.

The gaucho, the Argentine plainsman, sprang from the Spaniard and Indian. He was a nomad. His life of frugality, activity and hazard favored the fittest and fiercest. He knew no law save that of might. He was independent, daring, familiar with violence and careless of life. Had he through a Spanish parent some Moorish strain, he represented in the pampas his ancestors who had galloped over the plains of Arabia. In Argentina's wars of independence, 1810-16, the gaucho played an important part under General San Martin and General Bolgrano. In the civil wars that followed he fought under captains of more or less authority, and in the tyrant Rosas, 1830-52, he became the dictator over the lives and fortunes of the higher classes of society. Both in Argentine and Chilean history the tyrant now belongs to a vanished past.—National Geographic Magazine.

Mussels on the Sea Bed.

The mussel's natural home is at the bottom of the sea, never in very deep water and yet deep enough to be nearly always covered at any state of the tide. For preference it likes a bed of sand or smooth, fine gravel. To this bed it attaches itself by the ligature-like growth on the shell known as the byssus, and thus, standing on end with its point to the bottom of the sea, it forms itself in a dense mass so closely packed together that not an inch of the sea floor is visible. As new ones come they do not extend the ground space occupied, but range themselves one on top of another in layers, all firmly fixed together by a living cord of connection. In this position they are exposed to many dangers. A heavy storm may break the mass to pieces and disperse its constituents far and wide. Even if they escape this it is certain that bottom layers will be crushed out of existence.
