ONLY HOME GROWN NUTS SOLD BY EUGENE DEALERS

Eugene Register: Only home-grown walnuts will be sold in Eugene by local dealers hereafter, according to J. O. Holt, manager of the Eugene Fruit Growers' association, which is handling the local crop. Mr. Holt said that the dealers have agreed not to buy any nuts from California so long as the Willamette valley crop is sufficient to supply the demand and so long as the quality is as good as or better than that of the nuts shipped here from California. Mr. Holt said that most dealers expressed the belief that the local nuts are of better quality than the California product.
Prices recently set by the growers of the state are the same as set in California and, owing to the superior quality of the nuts grown here, it is believed that the entire crop can be disposed of without the least difficulty.
The Fruit Growers' association is drying the walnuts grown in this

vicinity in one of the evaporators at the big plant here. The nuts are placed in the prune tunnels, but a slow fire with much lower temperature than is used in drying prunes is used. It requires 48 hours to dry the nuts.
The walnut plant is equipped with a suction fan which draws out all "blank" nuts—those that have no kernels. They are much lighter than the good nuts and the suction easily draws them into a pipe and then into a receptacle.

What the World Is Doing

Racing Auto Takes Gas and Oil "On the Run"

While racing along at a speed of nearly 50 miles an hour to break a record, an automobile recently was supplied with gas, oil, water, and relief drivers without stopping the car during a 3,155-mile run made in 50 hours 21 minutes. Although three stops were made for tires during this time, the engine was kept going without pause.

All the other supplies were taken aboard, without stopping the machine, from another car which ran alongside during the period of delivery.

Radio Speeds Up Taking of Moving Pictures

Radio carried orders of the movie director to 5,000 members of the cast in a big scene in a western studio, recently. Where, usually, the megaphone is used to shout instructions, while camera men are turning the cranks, this director, standing at a point from which he had a clear view of all the actors, spoke his orders calmly into a sending instrument, which made it heard clearly all over the lot. The directing, somewhat difficult because of the number of people employed, was simplified by use of radio, and the movie man predicted that it will be repeated in other big scenes. The same system was used to increase the carrying power of broadcast messages and concerts at the receiving end. Use of radio in this case not only spared the director's voice, but it produced better results by making it possible for all the actors quickly to go through with the scene without frequent stops.

Make Poison-Gas Test in Three Minutes

Simple tests to find the degree of poisoning from a gas known as carbon monoxide are now possible with the invention of an instrument that shows how much a person has been affected within three minutes, where formerly it took from 24 to 48 hours before this could be accurately determined. The apparatus may be carried in the pocket and is expected to prove of particular value in mines, where this gas is a much-dreaded menace. Because of the compactness of the new instrument and the fact that it can be applied to a patient by one who has had no special training, it will be of broad general service, it is predicted. Government experts, who tried it on a young girl, assert that it is the quickest method known to detect the gas.

Tennis Court in Squares to Teach Accuracy

Looking like a great checkerboard, except that each square has a number, a tennis court has been devised to teach accuracy. While an instructor calls out the numbers, the player is required to place the ball in the required section. The practice provides train-

ing, not only for the hands and feet, but also for the mind, because of the quickness with which the numbers are called.
This ship, and the "ZR-3" that is being built in Germany for the navy, the first rigid dirigibles for this country, represent the most improved type of airship design. They will be filled with helium, the non-inflammable gas that is available in large quantities only in the United States.

Pacific's Bottom Is Charted by Timing Sound Waves

Charting the bottom of the Pacific ocean between United States and Australia is the task of a navy cruiser using a delicate apparatus to measure the time required for sound to pass from the surface of the water to the ocean's bed and return. Records are taken every five miles while the boat is moving. Knowing the speed of sound through water and the time elapsing between sending and returning of a signal serves to compute the depth.

Cozy Warm Blankets Await You Here

—and, what's more, each blanket shown you at this store has been selected to give the very best service and no sale of them to you is considered complete until you are satisfied. Come today and let us show them to you.
