Warm Current Exists, No Matter How Called

It was with some consternation that one read in the newspapers that the gulf stream had been proven a myth. If one of the sacred scientific trinity had died, what was to become of the others—the nebular hypothesis and the law of gravitation?

A closer reading, however, was reassuring, remarks the New York Evening Mail. It appears that M. Le Danou, a French savant, asserts that there is no such thing as a gulf stream. What is called by that name is a combination of ocean tides.

There are, he says, two kinds of water in the North Atlantic, warm and cold. The warm moves in a northward current to some undetermined point and turns backward again. The fluctuations, however, are tidal.

One has a vague memory of reading something very like that in the physical geography book about twenty years ago. Apparently the phenomenon exist, whether one explains them by the term gulf stream or as ocean tides. That which we call a gulf stream by another name will smell as sweet to migratory herring and sardine and happily, one can still paraphrase "Romeo and Juliet," regardless of whether Bacon or Shakespeare wrote it. And the warm Atlantic current still saves Europe from a return to the glacial period regardless of whether one accept the nomenclature of Franklin or that of M. Le Danou.
