Control Cutworms With Poison Bait

Bran Mixture Is Suggested for Use on the Early Spring Crops.

By C. H. Brannon, Extension Entomologist, North Carolina State College, WNU Service.

The use of a poisoned bran mixture to kill cutworms and prevent their damaging early vegetable crops is especially recommended.

Early in the spring, when the worms first get busy, the young plants are particularly susceptible to damage. Growers should watch their plants closely and apply the poisonous bait at the first sign of cutworms.

In experiments, best results have been obtained from a mixture of one pound of paris green to 50 pounds of bran. Sodium fluoride will also give good results, but lead arsenate and calcium arsenate should be avoided.

The poisoned bait should never be left where children or live stock can get at it.

About four pounds of bran-paris green bait should be applied to each 100 square yards of tobacco plant bed to control cutworms. No lumps will come in direct contact with the tender young plants.

For most other crops, the bait should be broadcast at the rate of 15 to 20 pounds to the acre. The bait should be applied a few days before the plants come up, or on the day they come up, at the latest. Applications are most effective in the evening so that the bait will be fresh when the worms go to work. New applications should be made after heavy rains.

The bran and poison should be well mixed while dry, then moistened with just enough water to dampen but not wet it. The mixed bait should not form large lumps or be sticky and mushy.

The bran and poison should be well mixed while dry, then moistened with just enough water to dampen but not wet it. The mixed bait should not form large lumps or be sticky and mushy.

The bran and poison should be well mixed while dry, then moistened with just enough water to dampen but not wet it. The mixed bait should not form large lumps or be sticky and mushy.
