

"Old Oklahoma" Has Outstanding Cast of Characters

An outstanding roster of players has been assembled by Republic to appear in its de luxe production, "In Old Oklahoma," based on Thomson Burtis' story, "War of the Wildcats," which is scheduled to open April 16th at the Arcade Theatre for a three day engagement.

Heading the cast is John Wayne, the virile, strong-silent-man of the screen whose performances in many recent films have been widely hailed by critics and public alike. He attracted attention in "Stagecoach," and followed it with such films as "The Flying Tigers," "Lady For a Night," "The Long Voyage Home," "Reap the Wild Wind," "The Spoilers," and "Reunion in Paris."

Martha Scott, who plays opposite him scored heavily in Thornton Wilder's "Our Town," and has since delighted audiences by her work in "The Howards of Virginia," "Cheers for Miss Bishop," "They Dare Not Love," "One Foot in Heaven" and "Hi, Diddle Diddle."

Control of Spittle Bugs Is Explained

Control of spittle bugs and root weevils on strawberries this year will probably pay better dividends than usual because of the certain demand at good prices for all that can be grown, says O. S. Fletcher, county agent. Recent crop reports indicate that the acreage of strawberries in Washington and Oregon to be harvested this year will be 20 per cent under last year.

Entomologists at Oregon State college report that spittle bugs are already beginning to hatch from over-winter eggs on strawberry plants.

As soon as the first spittle masses appear, the application of 1/2 per cent rotenone dust is due. Early injury is frequently severe to developing leaves and fruit spurs.

On large plantings the rotenone dust is applied at the rate of 50 to 60 pounds per acre, with either a hooded power duster or some type of rotary fan or blower. For smaller plantings various types of hand dusters are available. A thorough job of dusting which reaches the under side of leaves as well as the top surface is recommended, with a second application sometimes necessary two weeks after the first if spittle masses reappear.

Strawberry root weevils are also active already, and are feeding on leaves preparatory to egg laying. Two groups of weevils are serious in most parts of Oregon, the early group of which is due for baiting at once. Growers are advised to examine their plantings and if weevils are found around the base of the plants, or if injury to the leaves known as "ragging" is present, immediate application of bait is needed.

Use of the commercially prepared apple pumice or similar fruit bait is suggested this year, as bran and sugar for homemade bait are difficult to obtain. A hundred pounds of bait applied at the rate of one tablespoonful in the crown or beside the crown of each plant will treat one to three acres.

Use of the commercially prepared apple pumice or similar fruit bait is suggested this year, as bran and sugar for homemade bait are difficult to obtain. A hundred pounds of bait applied at the rate of one tablespoonful in the crown or beside the crown of each plant will treat one to three acres.
