

Modern Kitchens Need Modern Range Hoods

In today's home, the kitchen is no longer simply "the place where meals are prepared."

The kitchen's role has become more broad in recent years as it has become a gathering place or center of activity in many homes. As a result, greater emphasis is placed on making it a pleasant and attractive room in which people feel comfortable.

A key factor in providing a comfortable kitchen environment is seeing to it that the room is properly ventilated. And the most reliable and effective means to provide proper kitchen ventilation is with a modern range hood.

Your kitchen may already be equipped with a range hood, but it may not be offering you the advantages of the models currently on the market. Range hood manufacturers have kept pace with the changing role of the kitchen and now offer models which are responsive to the increasing demands placed on that room.

When it comes to indoor pollution, the kitchen is unmatched by any other room in the house. It is estimated that the average kitchen produces nearly 200 pounds of airborne grease per year. Unchecked, this grease accumulates on walls, cabinets or appliances, requiring frequent cleaning or even re-

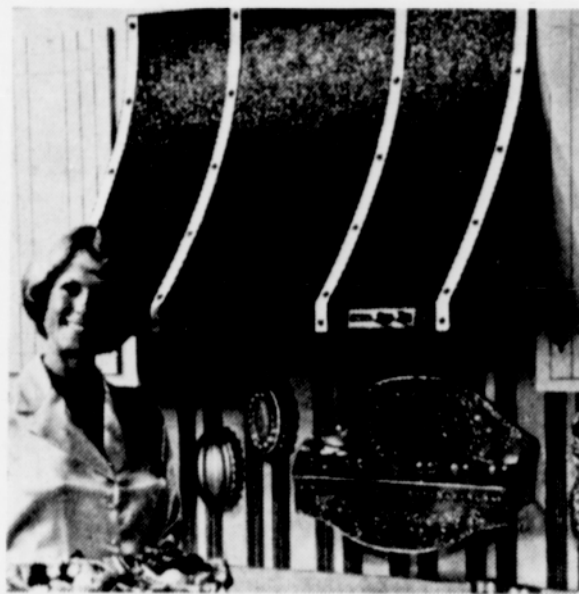

decorating.

Along with the grease, kitchens also produce an excessive amount of heat, smoke and moisture. These contaminants also can dirty kitchen surfaces. Further, moisture can penetrate walls and fixtures and accumulate to the point where it could cause serious damage.

Of course, odors often accompany cooking, creating an unpleasant environment not only in the kitchen but in other rooms as well.

Range hoods get rid of all the pollutants, providing a fresh, clean and healthful kitchen environment. Ducted to the outside of the house, the hoods expel these contaminants to the outside air where they are harmless. Or, where such ducting is not possible, duct-free hoods with double-filtering systems are available. These hoods freshen the air by removing the undesirable elements during the filtering process.

A final advantage of newer range hoods is quietness. The Home Ventilating Institute (HVI), a voluntary organization which certifies product performance and establishes industry standards, tests the range hoods manufactured by its members for levels of sound produced when in operation. Measured in sones, this rating appears on the labels displayed on the products of HVI members and

Modern range hoods are so attractively styled that they not only fit into but actually enhance a kitchen's decor.

provides a basis for assuring quietness when the hood is in operation.

Range Hood Selection

To do a proper job of removing kitchen pollutants, it is important that the range hood be properly selected and installed. The HVI offers a simple formula for calculating the capacity needed for a range hood to effectively do its job.

HVI recommends a minimum of 40 CFM (cubic feet per minute) of capacity per lineal foot of range for against-the-wall installations and 50 CFM per lineal foot for

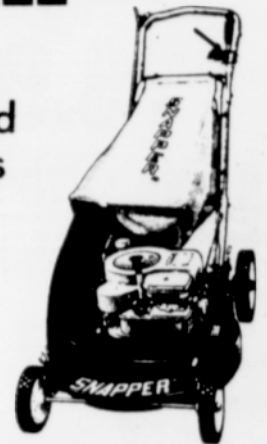

peninsula or island installations. The certified CFM ratings appear on the HVI labels displayed on all members' products and are your assurance that the product performance has been thoroughly tested and certified.

With respect to installation, HVI recommends that the hood span the entire length of the range and be located between 24 and 30 inches above the range. Range hoods are accompanied by detailed installation instructions and can be installed as a do-it-yourself project.
