

INDUSTRIAL NOTES

Laura Harnden is getting to be a fine little dressmaker.

Fortunato Jayme did some very nice printing for the Willamette University.

The sewing room girls are making some white aprons for the waiters in the dining hall.

Mr. Smith and a force of boys are repairing the drainage through the lowland where it was broken by cattle.

The Domestic Science girls made delicious cinnamon rolls yesterday, as can be certified to by some of the employes.

The plumber boys are putting the water and steam pipes into the new bakery under Mr. Chalcraft's directions.

A nut for the printer boys to crack? Why is it that the printing office is the dirtiest working department in the school?

The farmers these days are busy plowing and preparing the ground for the fall seeding. Four teams are kept constantly at work turning up the soil.

The gardeners, busy days are not yet over. They are now finishing up the patch of potatoes and preparing the nursery grounds for peach, cherry, and apple seeds.

The invoice has been received for a motor to run the printing press. This will be good news for the printers, to know that they have one less thing to kick about.

The dairy boys are turning out nice churnings of butter. The herd looks in fine shape and speaks well for the attention it is receiving at the hands of the dairy boys.

Mr. Bewley and the engineer boys are hard at work remodeling the boilers for the burning of coal. This work is quite strenuous but gives the apprentices of the department excellent experience.

The blower which Mr. Chalcraft designed to help out the draft at the power house until a new smoke stack is built, will be run by the little engine and will give us the force drafts necessary to burn coal.

Mr. Bowen and his industrials are now cultivating the extensive rose beds of Chemawa, and before this paper reaches its readers he will have placed a couple of thousand shoots in the nursery for a new crop of roses.

Mr. Woods has been hard at work between times drawing the plans and making specifications and estimates for the remodeling of the old hospital into a building to be used by Chemawa's Domestic Science department. This, when completed, will give very good quarters for this department.

The electricians have been changing some of the main line wires due to the pole having to be moved out from the new coal house. This is simply a preliminary work preparatory to remodeling the main line system, which the apprentices of the engineering department are doing under the supervision of their instructors.

When Mr. Campbell came into the printing office one day this week and said, "Here is some dope", he found that the boys in the office had not been educated up to that point in the art preservative. For the benefit of the printers who have to set this up we would tell them that "dope" is the printers' word for news.
