Famous Tree, 800 Years Old, Shows Signs of Wear

Mexico City.—The "great tree of Tule," in Santa Maria de Pule, state of Oaxaca, after 800 years, is beginning to show signs of wear. This giant cypress, with a trunk so huge it takes 30 persons with outstretched arms to span it is known to have been a fair-sized tree when Columbus discovered America.

History also recounts that Cortes and his Spanish soldiers slept beneath its branches four centuries ago en route to Honduras following their conquest of

There is no immediate cause for worry, however, that Tule, as Indians call the tree, will wither away before the present generation has passed on. And even if it should, Tule has a son some fifty yards away that is showing signs of maintaining the family honor. Hijo (son) already is so large 12 persons are needed to span it. Hijo is only a couple of hundred years old. The tree rises 175 feet. The spread of its branches is almost

SOLVING PROBLEM OF

Of Advantage to Market Roughage Through Stock.

Suggested to Farmer That He Discard Practice of Marketing His Hay and Feed It to Good Grade of Dairy Cattle.

(Prepared by the United States Department of Agriculture.) Farmers on some of the reclamaon projects where alfalfa hay is a cash crop will find it to their advantage to change their practice and market this roughage through live stock, says the office of western irrigation agriculture of the United States Department of Agriculture. On the Newlands project in Nevada the recent prices for alfalfa hay have been \$9 to \$9.50 a ton f. o. b. cars, which nets the farmers about \$5 or \$6 a ton at the stack. Although these prices are considered fairly good at present, figures collected recently on the cost of production go to show that when the farmer is unable to get more than

\$6 a ton at the stack there is a net loss. Indications are that \$7 a ton is nearer the cost of production, and this does not include any labor income for the farmer.

fair income on these alfalfa lands, church." it is suggested that he discard the practice of shipping off his hay and start feeding it to a good grade of dairy cows or to some other kind of live stock, particularly cattle and cry adopted during the northwestern

BENEFITS IN GROWING SEEDS

One Must Be Plant Expert to Be Suc cessful and Vast Amount of Labor Is Required.

Prof. Paul Work of Cornell, speaking on better seeds and how to obtain them, said there were many advantages in growing seed. One knows the percentage of his own seed, and if he grows his own seed and does it well he can turn a profit from the sale of the surplus; but you have got to be a plant expert and it requires a vast amount of labor and care to grow good seeds. It was his opinion that the bulk of the seeds would come from seedsmen; that men in the seed business are spending thousands of dollars to get good seed, while others were giving the matter of quality little attention, preferring to sell the cheaper seed regardless of quality.

FIRST CULTIVATION OF CORN

As Soon as Plants Are Above Surface Land Should Be Stirred-Deeper Tillage Permitted.

Much will depend upon early cultivation of corn. Here is where "a stitch in time saves nine." As soon as the plants are above the surface fly 500 miles in 12 hours if the weath-Heathsville, Va .- In Fleeton they the land should be stirred, usually. Un- er is fine. is said to have made some fine speci- if no heavy rains have come since planting it might be well to wait a while for a rain.

The first cultivation of corn will the brace roots develop. But care must be taken not to "throw much dirt" as the plants are easily covered and injured by the freshly plowed

SEED GRASS MIXTURES EARLY

Work Should Be Done as Seedbed Can ing gum and gild with gold paint. Be Put Into Shape-Fall Plowing Helps.

Grass mixtures for hay or pasture ourposes should be seeded as soon as the seedbed can be put in condition. The ground should be fall plowed so that it may be worked down by diskng and Larrowing as soon as the surface dries off. If the land was plowed last spring in seeding grain and the soil is in good physical condition it would be advisable to disk instead of plow in preparing for the seedbed.

FIRM SEEDBED IS NECESSARY

To Hasten Germination of Grass Seed Field Should Be Rolled After Harrowing.

A firm seedbed is necessary to hasten germination of grass seed. The field should be dragged or rolled after The surface should be left in a mellow condition but not smooth as it may bake and become crusted before the seed germinates,

Average Yield of Onlons. The average yield of onlons per acre in the United States is 231 bushels, on meet its fate as does the fly-on The highest average in any state is 570 bushels, in Idaho.
