HORSE SENSE

was never better demonstrated than when the animal voluntarily comes here to be shod. After once being shod here, a horse knows the comfort of our system and would prefer to come here always for his footwear. And you can rely upon the quality of the work in every particular, as well as upon saving yourself money.

VALUE OF THE SILO.

The silo is an established factor in American husbandry. While it is more commonly used by dairymen than by other feeders, the time is not far distant when the silo will be depended largely upon to furnish succulent food to all classes of farm live stock. The comparative merits of feeding a corn crop in cured condition or converting it into silage and then feeding it are as follows: The losses of nutrients in either case are about equal. The digestibility is about the same for each. Silage, however, is more completely consumed, more readily eaten and in greater quantity than when the same material is cured. It can be placed in the silo when ready regardless of the weather and when so disposed of is in the best possible condition for feeding and handling.

The silo is also much more economical in storage per unit of nutrients than any possible inclosure for dry, bulky hays or fodders. The labor and expense of harvesting and storing a crop for the silo come all at one time,

READY FOR WINTER FEEDING.

and further anxiety is over. It is ready to feed at any season and will keep, if properly made, for years. If the crop is cured and the forage and grain fed separately, the labor of preparation is endless and the forage soon loses palatability.

The above are some facts for doubters and procrastinators to think upon. It is not meant to have all corn converted into silage. Every milk producer, however, with ten cows should have a silo. Those keeping fewer cows should expand their business until a silo can be used advantageously. Materials should be ordered and plans perfected early in the year for a silo to receive the crop, as construction is always delayed, and if concrete or plastered silos are erected they need time to harden. The point is to be prepared to take care of an immature crop whatever the line of farming.

Dairymen voluntarily deprive themselves of many millions of dollars each year through a pernicious, wasteful custom of running their cows in the stalk fields all winter instead of converting part of the crop at least into silage and feeding it where the animals would be comfortable. An eminent authority concludes that there is 12 per cent greater return through feeding a crop as silage to dairy cows than by feeding the same in a cured form. The silo is indispensable in most lines of husbandry.—Herbert A. Hopper, in Charge of Dairy Extension, Purdue Experiment Station.

Developing Heifers' Udders.

Heifer calves should be handled very often to keep them gentle, and frequent manipulation of the udder during the first pregnancy will do much to stimulate development. This frequent handling of the udder is of no little importance not only in securing better development, but also to make the heifer so familiar with the operation that when her calf is dropped she will take the milking as a matter of course and will not require to be broken.

The heifer should drop her first calf when she is about two years old, as this will make a more productive cow than when delayed until another year. When the first calf is not dropped until the third year one calf and one year of milking are lost, and the heifer acquires a tendency to use her surplus feed in the laying on of fat instead of in the secretion of milk, a tendency which will be retained through life and which would have been avoided by earlier breeding.—W. R. Gilbert.

Cow Demands Regularity.

The dairy cow is a good timekeeper and knows very well when milking time comes. If she is neglected and allowed to go far beyond the regular time she begins to worry and loss follows. There are some cows that certain milkers can never get clean. They milk out all that flows readily and strip around once or twice, then call it finished. With some cows this answers, but with others the milker must reach well up on the udder and work it with a sort of kneading process. A little manipulation of this sort will cause the whole quantity to flow into the teats, whereas without it there will be from a gill to a pint of the richest milk left in the udder every time, which means a prematurely dry cow.

A Satisfactory Combination.

I know of no farm work so profitable as the breeding and feeding of swine in connection with the production of cream and raising of fruit, says a farmer in the Agriculturist. We turn our brood sows into an orchard of about four acres in the spring and feed them half rations of skimmilk, middlings and bran. This keeps them rugged and thrifty, and the pigs grow likewise. The trees look fine, and we get a good crop every year.

HEALTH OF THE HOG.

Measures That Should Be Taken to Protect the Herd.

After all, the old adage that an ounce of prevention is worth pounds of cure holds good in protecting the health of the hog. Cholera receives credit for killing many animals whose death is due to other causes. Many of these troubles can be guarded against or may be successfully treated.

In the way of preventive measures first and foremost stands the natural sunshine—the best antiseptic and germicide known. Here is where, other things being equal, the large, fancy hog house is less desirable than the small, individual farrowing house in which the sun can penetrate every nook and corner, drying, warming and disinfecting thoroughly every inch of surface.

It might be said to an almost equal extent that the more dipping the less disease, as the dipping process not only destroys the vermin, but stimulates the action of the skin and, reflexly, the digestive organs.

During last fall and winter several outbreaks of true hog cholera were caused by the lack of a little foresight in not properly handling breeding and show stock. No hog or pig should be placed among strange animals without first being kept in quarantine for a few weeks and dipped several times. In buying breeding stock or show stock, returning home they should always be dipped upon arriving and at the end of the quarantine period before turning them in with the rest of the herd. By quarantining, in this instance, is meant the keeping of the animals entirely by themselves and cared for by an attendant who never goes near the main herd until such time as it is decided positively that they have not been infected with disease.

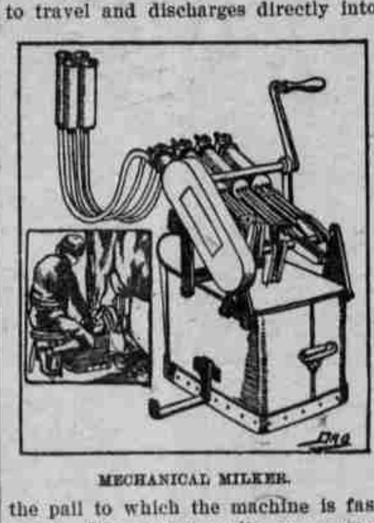
When symptoms of cholera appear in a herd it is wise to dip the whole herd, disinfect their quarters thoroughly, give them a slight change in feed and add to this about five drops of tincture of prickly ash for each hundred pounds of hog once or twice per day. The old remedy of wood ashes and salt is good in many instances. A little powdered sulphate of copper, dried sulphate of iron or charcoal given daily when the animals are not perfectly healthy frequently does much good.—F. S. Schoenleber, D. V. S., Professor of Veterinary Science, Kansas State Agricultural College.

NEW MILKING MACHINE.

Simple Device Used Abroad to Save Time In the Dairy.

A very simple mechanical milker is being used in Europe, and reports indicate better results than have been secured from any other of the several milking machines. It is so simple that a boy of ten years of age can easily operate it, says Popular Mechanics. It consists of four pumps which work in succession, one after another, and at the same speed as a person milking by hand. Each pump is connected by a short rubber tube to a teat cup, of which there are four.

The milk has only a short distance to travel and discharges directly into



MECHANICAL MILKER.

the pail to which the machine is fastened. The operator sits on a stool and turns a crank at the rate of forty-five revolutions per minute. The suction of any one of the pumps can be increased or decreased by turning a thumbscrew which controls the air passage. As soon as one teat is milked the suction is cut off and the cup removed, while the other pumps continue working.

Where several machines are used in one place, power through flexible shafting, one-tenth horsepower to each machine, may be used. With power one operator can superintend several machines. The device has been patented in all countries.

Clean Milk Utensils.

I believe the ordinary ten gallon milk can used for the transportation of commercial milk has been the cause of more trouble than any other one thing. Frequently cans which are supposed to be clean contain half a pint of filthy rinsing water. I believe there should be an ordinance in every village and city compelling the milk vender to wash and sterilize his cans thoroughly before sending them to the producer. In the washing of milk utensils you should not use soap powders or soaps of any kind which contain organic fat. By so doing you may convey to your milk undesirable flavors and cause to remain in your utensils deposits which will contaminate or deteriorate the milk.—John D. Nichols, Ohio.

Removing Tusks From a Boar.

A writer in the Kansas Farmer says, "The most convenient way that we have found to remove the tusks from a boar is to place a good, strong inch rope in his mouth, and by this means a couple of men can usually hold him in a corner of the pen while the third with a pair of sharp pinchers removes the tusks."

Agricultural College

Corvallis, Oregon.

Offers collegiate courses in Agriculture, including Agronomy, Horticulture, Animal Husbandry, Dairy Husbandry, etc.; Forestry, Domestic Science and Art, Civil, Electrical, Mechanical and Mining Engineering; Commerce; Pharmacy

Offers elementary courses in Agriculture, Forestry, Domestic Science and Art, Commerce, and Mechanic Arts, including forge work, cabinet making, steam fitting, plumbing, machine work, etc.

Strong faculty, modern equipment; free tuition; opens Sept. 25.

Illustrated catalogue with full information on application to the Registrar, free.

The Oregon Good Roads Conference will convene promptly at 8:30 a. m., Tuesday, August 11th, in the convention hall of the Portland Commercial Club, 6th floor. Another meeting will be held at two o'clock, and perhaps an evening session. A feature of the convention will be the attendance of many road supervisors and practical road officials.

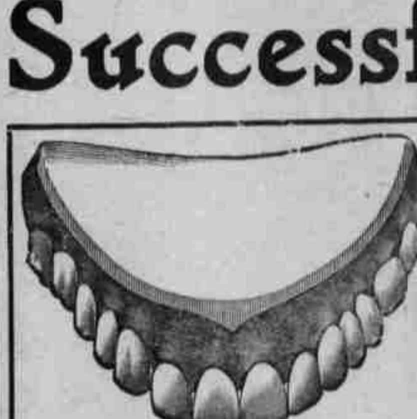
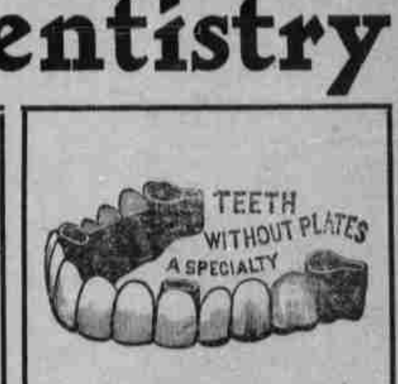
Successful Dentistry



The New Gold Fillings

We never have to tell you that "your teeth are to soft to hold Gold Fillings." We mastered that difficulty long ago.

We put Gold Fillings in those so-called "Soft Teeth" that do not come out. Our Gold Fillings, no matter how large, cannot come out when put in by our new process. They are solid as rocks and strong as iron. Call and see them.



THOSE WHITE FILLINGS

We never fill your teeth with Cement or Artificial Enamel and tell you "IT WILL LAST AS WELL AS GOLD" for it will not and we know it. So do others.

CROWNS AND BRIDGES

Our Gold Crowns, Porcelain Crowns and Bridges are works of art and stand the test of time. We Guarantee our work, but our best guarantee is our 18 years of successful practice in Oregon City. You can always find us at the same place.

SKIN ON FIRE—AGONY UNBEARABLE.

Terrible Itching, Burning Skin Disease Now Quickly Cured.

A purely vegetable external remedy that has been proved beyond all possible doubt to cure the worst cases of eczema and all skin diseases can now be procured by all skin sufferers. This remarkable remedy is D. D. D. Prescription, the discovery of Dr. Decatur D. Dennis, the well known skin specialist, and is being manufactured by the D. D. D. Co., 112 Michigan St., Chicago, Ill. The demand for this remedy has become tremendous within a short time because people are just learning that the hundreds of cures it has made seem to be permanent.

Eczema and all diseases of the skin must be treated locally, according to the views now held by foremost skin specialists and physicians; that is, you must doctor the itch where the itch is. It is useless to attempt to cure skin disease by taking drugs and medicines into the stomach. The disease is not in the blood. It is in the skin and only skin deep. You must get at th seat of the disease and kill the germ by making direct applications to the skin.

Mrs. L. B. Powell, Box 414, Caruthersville, Mo., writes: "Words cannot convey my full appreciation of D. D. D. The face of my baby boy was a solid scab., when I accidentally heard of D. D. D. I secured a bottle at once and began to apply it. It was miraculous in its cure. It healed my baby's face completely. If anyone wants further information about this I shall be only too glad to hear from them."

Testimonials of hundreds of cases of remarkable cure by D. D. D. Prescription and an interesting booklet on skin disease and its treatment, exercise, diet, bathing, etc., may be had free by calling on Jones Drug Co., Oregon City, where D. D. D. Prescription and D. D. D. Soap will be found on sale.

Granulated Sore Eyes Cured.

"For twenty years I suffered from a bad case of granulated sore eyes, says Martin Boyd, of Henrietta, Ky. "In February, 1903, a gentleman asked me to try Chamberlain's Salve. I bought one box and used about two-thirds of it and my eyes have not given me any trouble since." This salve is for sale by Huntley Bros., Oregon City and Molalla.
