CUT ALFALFA AT CORRECT PERIOD

Best Plan to Delay Harvesting Until the Plants Are Nearly in Full Bloom.

LIFE OF STAND LENGTHENED

Recommended That Crop Be Given Time to Reach Height of 6 to 8 Inches Before Cold Weather Shuts Off the Sap Flow.

(Prepared by the United States Department of Agriculture.)
Delaying the cutting of alfalfa until it is nearly in full bloom has been found a better practice than mowing it soon after blooming starts. Trials made by the United States Department of Agriculture and state experiment stations indicate that the yields are larger over a period of years, and that the life of the stand is prolonged by delaying harvesting until the plants are nearly in full bloom.

Hay made when the plants are nearly in full bloom possibly is not quite so palatable, but this is offset by the gain in quantity of hay. The fields that were cut prior to or at the beginning of blooming showed a tendency to die out sooner. Cutting a crop late in the fall so that not enough growth was left for protection in the winter also had much to do with thinning stands. The department recommends that alfalfa be given time to reach a height of six to eight inches before cold weather shuts off the sap flow.

Broadcasting Best Plan.

In the past the growing of alfalfa in rows in dry regions has been recommended, by experimental evidence gathered by the department in the last few years shows that, with the exception of a few rare varieties the seed of which sells for a high price, this method is seldom practical. Where the rainfall is not sufficient to grow alfalfa in broadcast stands it cannot usually be grown profitably in rows. A slightly larger yield may be produced, but not enough to pay for the added expense. Also, the hay harvested on this cultivated ground is apt to be dirty and it is hard to cut and load.

Value of Cultivation.
Accumulating experience also has exploded some old notions about the value of cultivation of broadcast stands. It has been found that har-

rowing a field of alfalfa ordinarily does not increase the yield; neither does it prolong the life of the stand to any noticeable extent. The modified

Cutting Alfalfa.

spring-tooth harrow does not injure the plants, but the disk often kills many and reduces the stand. Some sort of cultivation appears advisable in irrigated regions where the water carries a great deal of silt or where the soil has been compacted by the tramping of cattle pastured on the alfalfa. The department believes there is usually little to be gained by cultivating broadcast fields when the stand is good. If weeds and grass work in and reduce the stand it is better to plow up the field and put in another crop for a year or two. It is hard to thicken a thin stand by cultivating it and sowing more seed; in fact, it is a waste of time, the department believes.

LIME INFLUENCE IS LASTING

Where Applied in Liberal Quantities Soil Shows Beneficial Effects for Years.

It has been observed that where lime has been applied in fairly liberal quantities to soil, the soil shows the beneficial effects for a number of years afterward. In long-time tests made by the Ohio experiment station the crop yields during the last six years of a 13-year period were much larger than during the first seven years.

West Linn Council Meets

GIVE YOUR BEES NEEDED AIR

Reversible Bottom Board Furnishes Either Narrow or Wide Entrance as May Be Desired.

It is too much to ask of a hard-working bee that it hang outside the hive during its hours of rest because the interior of the hive is too hot and poorly ventilated. "One remedy is to tip up the front of the hive one inch from the base board, using a tapering spitzer or wedge under each side," says A. C. Burrell, extension entomologist of the Missouri College of Agriculture. "Or buy a reversible bottom board, which furnishes either narrow or wide entrance as desired. We do not advise setting the supers back a half-inch as this artificial ventilation interferes with the fanning bees. Keep your bees in a good shady location for the hot summer months."

Different farmers have different ways and means of caring for their barnyard manures, but suffice it to say, do not let it become exposed to the rain nor the sun; if possible, keep it piled up in order to prevent the escape of gases which are rich in plant food; as often as practicable, haul the manure to the fields, scatter and immediately plow it under.

The Dragon

I am more powerful than the combined armies of the world. I have destroyed more than all the wars of the world. I am more deadly than bullets, and I have wrecked more homes, than the mightiest of siege guns. I steal in the United States alone over \$500,000,000 each year. I spare no one, and I find my victims among the rich and poor alike; the young and the old, the strong and the weak, widows and orphans know me. I loom up to such proportions that I go into every corner of the earth leaving behind me destroyed homes, factories, ships, cities or anything that may get in my path. I am your worst enemy, yet few take the necessary precaution to avoid me.
