The real value of a motor lubricant can be determined in only one way—through its use in the engine for which it is intended.

Hence this company maintains an engine-testing lab-oratory, equipped with a Sprague dynamometer, in which Zerolene and other lubricants are constantly being tested under actual operating conditions.

This dynamometer laboratory is in charge of competent trained men, who spend all their time in conducting comparative tests of Zerolene and other lubricants in

automobile, airplane, marine, truck and tractor engines. Correct Lubrication Recommendations

On the results of these tests, supplemented by equally careful tests in the field and on the road, our Board of Lubrication Engineers bases its Chart of Recommen-

Close attention is given to the design and construction of the engine. It is necessary to know, first, the speed of the bearing surfaces; second, clearance between bearing surfaces; third, temperatures at which bearings operate; fourth, pressures exerted in each bearing; fifth, the means provided for the distribution of the oil to each bearing.

The recommendations embodied in the Zerolene Chart are calculated with the greatest precision, and if Zero-lene is used in accordance with them, correct lubrication and maximum fuel mileage are assured.
