that may be on the surface. soil is too wet, or the first of these objects will not be accomplished. Instead of being pulverized, the slice together more firmly than ever and

will bake into a hard clod. The furrow slice will also turn up cloddy if the soil is too dry.

A good way to tell when a field is in proper condition to be plowed in to squeeze a ball of the dirt in your hand. If it sticks together in a pasty mass you had better let it dry a few days longer. If it hangs loosely together in a mealy ball the plow can be set to work at ouce. Such soil will fall over the edge of the moldboard in loose, crumbly massea. The field will not be ridged like a washboard, as too many fields are, but will aptly demonstrate the truth of the old saying that "a field well plowed is half harrowed." In order to do a neat job of plowing

a colter and a weed book are necessa-

FIG. Y-A GANG PLOW AT WORK.

ry attachments. By using them all the trash can be turned under completely. This not only hastens the decay of such matter, but also adds greatly to the looks of the field. Too many farmers do not pay enough attention to looks. A ragged looking field may raise just as large a crop as a smooth one, it is true, but the farmer who is careless in his plowing is likely to be carcless in everything else.

If the plowing is done in the fall it.

and the roots will have difficulty in getting through it readily. A good plan is to begin at, say four inches, and plow one-half inch deeper each year until a depth of seven or eight inches is reached. Then go back to four inches and begin over again. In this way a little new soil is turned up every season and the layer of surface soil gradually deepened.

Spring plowing should be shallower than that done in the fall. The soil is full of tiry pores, its structure being much the same as that of light bread. If you will put one corner of a slice. of bread in a dish of water you will notice that it becomes wet for a considerable distance above the surface of the water. This is caused by the moisture flowing upward through the little holes in the bread. The force that causes water to rise in a small tube is called capillarity. It is this capillarity that makes the water rise from the subsoil up to the surface where the roots can use it. The smaller the capillary tubes the faster and higher the water will rise.

When the ground is plowed these capillary tubes are broken up, and the rise of water is checked. To start it again the soil must be allowed to settle for a long time or else be worked down with the disk, harrow or roller. In the fall the depth of plowing does not matter, since the furrow slice will have all winter in which to settle. But in the spring this capillarity must be restored almost at once or the surface layer will become so dry that germination and later growth will be checked. Hence the importance of shallow plowing, so as to reduce the labor of disking and barrowing. If the surface of the ground is crusted or if there is much trash to be turned under the field-should be disked before it is plowed. This will provide for a layer. of fine dirt in the bottom of the furrow, which will pack down closely

and help to restore capillarity. If the furrow turns up "shing" or shows any tendency to bake into clods It should be harrowed every half day." or every day at least. This seems like a great deal of extra work, but if a harrow is kept in the field it does not take long to hitch on to it and go over the newly plowed strip just before guitting for noon or night. A few

has so much to do with the times will pulverize the ground more readiness with which the plants than hours of work after it has be-

more than pay for the extra labor. Mr. and Mrs. Myers, who reside east. One of the prettiest home wedding there is an additional advantage in of town had 25 of their best chickens that has taken place in Canby was of the control of the prettiest home wedding that has taken place in Canby was of the control of the prettiest home wedding that has taken place in Canby was of the prettiest home wedding the control of the prettiest home wedding the prettiest home wedding the prettiest home wedding the prettiest home. Plowing should not be done when the that the surface is left smooth. Disking spring plowing is seldom neces

In cases where improper plowing has left a field cloddy the roller may often be used to advantage. A cerrugated land, visited with Mr. and Mrs. Elmer Stropp, of Portroller is better for this purpose than a Charles Roth over Sunday.

Rev. W. J. Weber performing the impressive cerdemony. The briday roller is better for this purpose than a Charles Roth over Sunday. turned up by the plow will be packed left a field cloddy the roller may often be used to advantage. A corrugated roller is better for this purpose than a smooth one, as it tends to crush the clods rather than to simply push them down late the finer dirt. A home made "planker" or clod crusher will often answer the purpose as well as a roller.

The roller packs the ground considerably and so quickens the capillary rise of water. If the surface is left smooth much of the moisture that comes up will be lost by evaporation,

comes up will be lost by evaporation, grip.

and later in the season the crop will be likely to suffer from drought. To ready for occupancy this week. avoid this the roller should be followed immediately by the harrow.

This toosens a thin layer of surface soil. When the capillary water reaches this loose layer its rise is checked, and comparatively little is lost by evaporation. For this same reason it is often well to harrow fall plowing as soon as it is dry enough in the spring. especially if disking is not to be done until late.

After the ground is plowed and disked the harrow must be used to complete the preparation for planting. There are many kinds of barrows, but none that are better than the ordinary spike tooth. These are made in all styles and sizes. The harrow is eco-nomical to use, since it gets over ground so rapidly. The best time to harrow in order to pulverize the soil is immediately after a light shower. The little clode will then be softened and will be easily knocked to pieces. To kill weeds, however, it is better to wait until the soil is a little drier, as harweeds rather than destroy them.

Do not be afraid to harrow too much. No work that you can put on a field pays better. No other implement will kill as many weeds in so short a time.

while plowing stalk ground is unnecessary, it will usually be found profitable to disk the land before seed that. This chops up the cornstalks and provides a mellow layer of soil for the seed to germinate in. for the seed to germinate in.
