Eggs of the Guillemot.

The guillemot is distinguished among British birds by the fact that its eggs vary more in color than those of any other species, ranging from dark reddish brown to pale green. The female guillemot lays only one egg at a time; but, like the mother of an only child, ahe pays great attention to it. To hatch it she holds it between her legs as she sits facing the cliffs. Taking the eggs is a regular profession in some places, such as at Flamborough Head, where the birds congregate in great numbers. The albumen obtained from them is said to be used in clarifying wines and in the preparation of patent leather .- London Standard.
