The hop picking is about over and a good harvest is reported. The few rainy days that intervened proved a benefit, at least to the pickers, besides giving an interval of relaxation they afforded the opportunity of putting the homes in their usual order. While this was going on the hops were growing ripier, greatly facilitating their removal from the vines, thus making the work far quicker and easier than it had been before.

FACTS ABOUT BABIES.
Some That Surprised and One That Pleased the Professor.
"I never knew before I had one," said the professor of physics to his bachelor assistant, "just how closely our science could be applied to a baby. I have been astounded at the following true conclusions:
"As two similar bodies vary in weight as the cubes of their dimensions, I find that a baby two feet long should weigh just about one-sixteenth of a man five feet high; also that, as the surfaces of two similar bodies vary as the square of their dimensions, a baby as before would have about one-sixth the surface of the man. So the extent of surface proportional to weight in the baby is vastly greater than in the adult. In fact, a square foot of the baby's skin would shield just one-third the substance of what a square foot would on an adult.
"Arguing from this and knowing that the rate of cooling of a solid depends on the extent of surface, I found that a baby got cold quicker or warm quicker when exposed to a fire than a man; also, as any living body is higher in temperature than the surrounding air and has to lose heat continually—the rate of loss depending on the surface—it is readily seen that a baby, in order to keep up normal temperature, has to furnish more heat in proportion to its weight than man, and therefore has to eat more in proportion to its weight than man. To prove that a baby gives out an enormous amount of heat, keep the heat from escaping by wrapping a heavy blanket around it. In a half an hour the temperature under the cover will be almost unbearable to the hand, and the baby will be found covered with sweat.
"The same knotty problem comes up when the baby is bathed. You know yourself how cool you feel when you bathe in a cold room in warm water, but in very little of it, so that most of your wet body is out of the water on account of the heat of your body being taken to evaporate the water? The baby suffers much worse on account of that same big proportion of surface.
"But I find one encouraging thing in this peculiar geometrical problem of the human form. I find that if a dress is made for my little daughter two feet high and one for her mother five feet high, it takes only one-sixth the cloth to do it, although the dresses were made in exactly the same style."
