A New Method

## Mrs. Nevada Briggs, the baking expert, says:

"There is just one way to make your cakes rise high and evenlygive them time to rise before a crust is formed and the batter is stiffened by cooking."

"If using a gas, gasoline or oil stove, light your oven when you put the cake in and keep the flame low until the cake has doubled in bulk; then increase the heat until it is evenly browned and will respond to the pressure of the finger. If using a coal or wood range, leave the oven door open until the cake is in; then turn on the drafts and by the time the oven is at baking temperature, the cake will have raised sufficiently."

For rich, moist, feathery cakes Mrs. Briggs always recommends

It is double acting and sustains the raise. You can open and close the oven door, turn the tin around in the oven or do anything else necessary, without any danger of making the

cake fall. Try your favorite cake next time with K C Baking Powder and see how much higher it will rise. Make it just as you always do, with the same quantity of baking powder. While K C is less expensive than the old fashpowder. While K C is less expensive than the old is ioned baking powders, it has even greater leaven strength and it is guaranteed pure and healthful.
