## NOW IS THE PROPER TIME TO REMOVE CANKER SPOTS

An exchange says: Between now and March is the proper time to seek out the cankers and prepare for their destruction; better results are promised by early fall removal.

There are three forms of canker—the blister, the black rot and that from the pear blight organism. To meet canker, early pruning and burning of dying branches and removal of canker spots on living trunks and branches are urged. The diseased bark, etc., from such spots must be burned if spores are to be destroyed and infection reduced.

The treatment of apple orchard canker involves also the treatment of large wounds or pruning wounds as well as those caused immediately by the removal of cankers. Dead limbs will require to be cut off close to the trunk or large branch. The same applies in all pruning. No dead stub should remain to open the way for further infection.
