not the efficacious. At the same time, however, it is not so easy to find a cure for the disease, and when it is found, it is not always possible to apply it with success. It is well known that all these symptoms, though they may occur in one individual, are not always accompanied by any serious morbid change. The disease may be successfully treated by means of purgatives or by the use of the feverish or hot baths, and it is very important that the medical attendant should be driven from his duties by putting drugs into the stomach. But one thing is certain, that in the most acute cases to which we have been subjected, the treatment has been successful, and the patient has been cured.

The disease is known as the "flu," and it has been observed in the most acute cases to which we have been subjected. The symptoms are very similar to those of the common cold, and the disease may be successfully treated by means of purgatives or by the use of the feverish or hot baths, and it is very important that the medical attendant should be driven from his duties by putting drugs into the stomach. But one thing is certain, that in the most acute cases to which we have been subjected, the treatment has been successful, and the patient has been cured.
