THE MORNING OREGONIAN, FRIDAY, AUGUST 10, 1900.

CHEMISTRY IN 1800 AND 1900

THE OREGONIAN'S HOME STUDY CIRCLE: DIRECTED BY PROF. SEYMOUR FATON

Sermour Eaton)

COMPARATIVE STUDIES OF TWO CENTURIES

ET PROFESSOR PAUL C. FREER. VIII.

At the beginning of the 18th century chemistry had just been emancipated from the influence of medieval superstition and had established its right to tion and had established its right 10 m considered an independent science, with the consciousness of a basis for future individual development. Almost from the Christian era it was stunied by the ignis fatuus of alchemy and latro chemistry, its spie reason for existence being the lication of the few known facts to the conversion of the baser metals into gold, or to the exploitation of so-called medi-cinal remedies. The knowledge thus far collected was incidential to these purposes. and the prevalent theories were borrowed from the ancients or Arabians. All known arount the encodes were supposed to be formed by warying proportions of the essential prin-ciples earth, water, fire, air, mercury, sulphur, and sait. Experimential science, baving for its object the establishment of fundamental theories, derived by the correlation of observed facts, was un-

known. Chemistry as an independent science owes its origin to Robert Boyle, who in the middle of the 17th century was the first to courageously oppose the older doctrines advocated by the peripatetics and who by a series of masterly writings sought to replace the vague notion of principles by moore definite chemical ele-ments, defined by bim as substances. which could not by ordinary means b disintegrated into two or more simpler bodies. It is true Boyle frequently erred in his conclusions, as for example, when the considered glass and water to be chem-ical elements, owing to his inability to decompose them. Although his methods were often weak, his conclusions were sound and his brilliant experimental gentus finally succeeded in establishing the sciences on a firm basis, even render-ing the "black art" fashionable at court; Kings and Princes neglected ordinary af-Tairs of state in order to dabble with the "spring of the air" and kindred top with

Although Boyle revolutionized methods It was not until the beginning of the 18th century that the endire scientific world abandoned the older views and the way was opened for the establishment of the dist chemical theory which undertook to ect a series of obviously related Until this necessary advance was made no substantial progress could be moted, for all the efforts of investigation ended merely in aimless wanderings. Th first scientific step opened the way for consistent and vigorous advance. The first theory was subsequently discarded because it was founded upon qualitative and not quantitative observation of chem-

and not quantizative observation of observa-load phenomena, nevertheless its benefit was incalculable, for it outlined a definite and preche course for future experimen-tation. The theory is known as that of phlogiston. Its object was to explain the changes taking place during combustion. All matter while burning was believed to separate a principle termed phicgiston, so that the remaining incinerated product was supposed to be of simpler com sition than the initial substance. The fault of the theory was that in reality holies during burning gain in weight, a separation sceming, therefore, less like-15 than a union. A further development 56 years was required before workers the science realized this fact. The

tion period was one of great activ-the chemical field, and many no able discoveries occurred under its aus ices. Particularly was this true of the nrious games such as curbon aus oxide (laughing gas), niof varios trie exide, ammonia gas, muriatic aclo gas, chlorine and lastly oxygen and hystraitent. Black, Priestly, Scheule, Watt Cavendish and many other men added lus-ter to the science. Considerable progress was made in chemical industry: the manufacture of sulphuric acid developed and oward the end of the century when the phiogiston theory was already giving way to our modern views the dry distillation of bituminous coal and the manufacture illuminating gas, coke and tar began

The phiogiston period was brought to an end about 1780-178 by the accurate re-searches of the Frenchman Lavoisier. This investigator demonstrated combus-tion to be a union with one of the constituents of the atmosphere, a gas which Priestly and Scheule had discovered and which Lavoisier named oxygen. Sub-stances in butning were shown to have gained weight, and this gain in weight was demonstrated to be commensurate with a loss suffered by the air support-ing the process of burning. Chemical ele-ments, as they are today, were defined as forms of matter which, when alone, could not be changed into two or more simpler bodies, and the products of com-bustion were therefore shown to be com-pounds. Lavoisier's crowning work was the final proof that water is a compound of hydrogen and oxygen and the firm esapplishment of the law of constanc matter. A new system of nomenclature substantially the same as that of today was introduced, and the way was opened for the marvelous advances made in the 19th century. After the death of Lavolster, in 1782, a earnest investigators carried or his work; new elements and compou were discovered and by 1806 the way was clear for the establishm ent of the fur mental law governing the composition of chemical compounds known as the law of constant proportions (Proust). All true compounds were recognized as chemical having their constituent elements com-bined in constant and unvarying ratio by weight, and although a bitter opposition to this view was carried on by the eminent scientist, Berthollet, the facts vealed by careful analysis established the and from that time all chemics was based upon their understand ing. Almost simultaneously with this advance, the present theory of atoms, which has been of immeasurable benefit progress of the science, was dein the the laws governing the combining vol-umes of gases were discovered by Gay-Lussac in France, thus serving to firmly establish this theory in the chemical Chemical industry received a great impetus from the intense activity in the theoretical field. The isolation of France during the Revolutionary period caused bet to make an earnest effort to supply chemicals previously purchased abroad, and as a result the Le Blanc process for the manufacture of soda originated there. Until recently it was the sole means of producing this important chemical. Owing is the possibility of the commercial production of chlorine, bleaching powder came into use; ammonia was generated in quantity from the gas works, which were increasing in number, and the cul-tivation of the sugar beets and the means of marketing the product, a diffi-cut chemical problem, began to gain The period in the history of chemistry immediately following the understanding of the law of definite propertions was until about 1822 malaby devoted to defin-ing and entarging the views aiready established, the principal object being to investigate the subject of atomic weights, which were chemical quantities defined by Daiton, and about the exact interpre-tation of which bitter controversy refigned. The conflict thus precipitated stimulated research and served to hasten the discovery of many new elements and compounts and to perfect the methods of analysis. The Swedish chemist Berpellus, a man of endurance, untiring en ergy and experimental skill far beyond that of any of his contemporaries, was the most notable figure in the chemical world of this period. In addition to his pre-eminent desterity in the laboratory

he was a voluminous writer. The results of his researches were complied in a man-ual of chemistry, which first appeared in the Swedish language and which was sub-sequently translated into German by his friend Wohler. The general chemical field was reviewed in an annual compliation. By means of his activity and his excep-tional facilities for bringing his views he al facilities for bringing his views h fore his collengues Berzellus succeeded during 30 years in completely dominating

the science. The period from 18% to 1815 was fruit-ful in the discovery and isolation of new elements, over Z being added to the known list. Mineral analysis almost reached the standard of the present day and the study of crystalline forms and committee the standard of the present day crystallography began to establish itself as an independent science. Almost all of the experimental results obtained were discovered with reference to the possibility of determining the relative weights of the atoms of the elements. Two opposing schools arose, one maintaining that the accurate understanding of these small quantities would be forever an impossibil-ity, the other that a judicious combina-tion of laboratory results with theoreti-cal reasoning utitumeter would lead to cal reasoning ultimately would lead to

chi rensoning ultimately would lead to dednite conclusions. The latter view fi-nally triumphed. Until 1825 a sharp division existed be-tween so-called inorganic chemistry and that portion of the science termed organic. The substances with which organto be the product of life action only was believed that any attempts at lab tory formation of the products of living organisms would fail. In 1828 Wohler with one stroke broke down the barrier. He succeeded in synthesizing urea, which had been considered solely the result of phy-siological action. The result opened a new field for chemical activity, and in a few years many men were engaged in inves-tigations which led to the production of a large number of new substances and their derivatives, all containing the elements carbon combined with hydrogen many of them also with oxygen, nitrogen and phosphorus and sulphur. The pos-sibilities of this new branch of the sci-ence, still termed from habit organic chemistry, were practically unlimited, but the old controversy in regard to atomic weights was not settled. Its development was retarded owing to the misunderstand better. ing of chemical principles. In 1832 Liebig and Wohler published a long research of the oll of bitter almonds which did much to clear up existing misconceptions, and a few years later the French chemists, Dumas, Laurent and Gerhardt, made a further advance by the discovery of chlo-rinated acetic acid and alled bodies. The ception of the nature of organic sub-nees and of the mission of this branch of chemistry became clearer. In the early '60s Kekule in Bonn and Frautiand and Williamson in England finally brought or-der out of chaos and placed the science on a theoretical basis which has been fol-lowed to the present day. lowed to the present day. Meanwhile, although much time had been spent in theoretical discussion, ex-perimental work had grown rapidly, and the result became apparent in a practical way. In 1825 Farady discovered benzene to the discussion of the discussion in the oil obtained from the distillation of coal for gas works. In itself the dis-covery was apparently of no practical importance, but yet this same sub-tance was 20 years later to become the oll from which was derived aniline and many

ish steamer Palestro, from Pensaco'a, Fia., for Liverpool and Newport N w for ccal, stranded this morning on Dia-mond Shoals, and cannot be saved. The crew are safe.

THE AMATEUR REFORMER.

Meeting That Resulted in Embarrassment for One Participant. "Glad to meet you, Mr. Berkenhead,"

he said, acknowledging the introduction, "but we have met belore." "Indeed, Mr. -" "Gwilliams."

'Mr. Gwullams, just at the moment .

"O, the pleasure was entirely on my mide. I was in the audience. You were the speaker. I attended the political meeting you addressed at Grassyhurst the other day.

Well, I had the first word, auy-'I see. I hope the speech was to your liking.

"Very much. I was particularly im pressed with that portion of it in which you said that the President, while he might be above the reach of the people, cortainly cond' not be beyond their cen-sures. I __imired this because Sir Francis Bacon made a bungling atempt 383 the same thing in his letter to the Duk of Buckingham in 1616, only instead of President he said King James, you re-

'Ah, yes, that was a-er-sort of colnciden

"I was impressed, too, with the forcible manner in which you spoke of the nego-tiation for the same antion of Hawai as having 'begun with a political jockoy named Sanford B. Dole.' for Charles Sumner tried to use the same expression when he said in the Senate, some time in 1870, I think, that the negotiation for the annexation of San Domingo, proposed by President Grant, began with a political jockey named Buenaventura Somethingor-Other. I have always been fond of

"You seem to have been on the watch, Mr. Gwilliams, for plagiarisms, but those are such trifling examples-" "Bless you, Mr. Berkenhead, I don't

speak of them as plagiarisms at all. You improved everything you touched. For example, your remark to the effect that it is the balance of our trade with for-eign nations, not altering the standard of our coin, which increases or lessens our builton at home,' was a decided improve-ment on the clumsy utterance of John Locke, author of the 'Essay Concerning the Human Understanding,' who used the word 'countries.' I think 'nations' much

"It pleases you to be sarcastic, Mr.

Gwilliams." "Not at all, Mr. Berkenhead. I was never more sincere. For example, again, when you said of Roosevelt, 'His hour had come; he promptly grasped the lead-ership thus left open. Starting out de-liberately for the Preadential nomination, his plan embraced three leading features His stepping stone was the Governor-His stepping stone was the Governor-ship, his shibboleth administrative re-form, his method a pretended opposition to Boss Platt.' It sounded familiar. i hunted it up and cound it-all except the Boss Platt part-on page 574 of 'Bialne's Twenty Years of Congress,' second vol-ume. The deft manner in which you made a masterly arraignment of Samuel J. Tilden do service in a diatribe against Teddy Roosevelt challenged my highest admiration. So, too, when you ob-

admiration. So, too, when you ob-served that 'it would be difficult in the whole compares of history to find another instance in which such various and such powerful agencies concurred to degrade the character and to blast the prosperity of a nation,' and that 'the greater part of the modern coal-tar products. The waste tar of the gas works, formerly a nuisance, is now redistilled and retined. It produces all the innumerable dyes which are in use today, as well as antiof them sprang directly from the corrupt and selfish party now in power and from the greed of organized monopoly,' and so forth, you made a little the cleverest use of a quotation from 'Lecky's History of England in the Eighteenth Century' of other modern modicinal remedies. No branch of chemical industry has shown greater advances than into of coal tar and its derivatives, and none can rival for a political purpose that ever came under my notice. Such a thing is enough to make the author clap his skeleton hands together and applaud you in his grave-if he happens to be dead. Web. Davis himself couldn't have done it bet-

and its certratives, and none can rival it in the multiplicity and the varied ap-plication of its products. Anline was first systematically investigated by Hoff-man in 1843. The first aniline dys was placed on the market in 1856 by Perkin in England. In 1865 Graebe and Liber-mann produced artificial madder which later entropy reals of the entropy of the start of the systematical systematics. "If I had thought there was a man in that audience looking out for a chance to pick little flaws in my speech I would have saved him the trouble of hunting up later entirely replaced the natural prod-uct and caused the entire revolution of agricultural methods in France. Subsethe references by giving chapter and verse for every quotation-" "Pardon me, adaptation."

"Excuses me, sin-" "No excuses necessary, Mr. Berken-head. We all do it. I was a candidate for office once myself, and made several speeches. Judgeship, or Congress, or the Legislature, or something of the kind. quently Baeyer succeeded in accomplish ing the difficult task of preparing artifi cial indigo. Of recent years one of the greatest advances in organic chemistry has been accomplished by Emil Fischer in his exhaustive work on the group of I am not entirely certain now what it substances known as sugars. He has at was, but I remember I didn't get it. Didn't even get the nomination, though the Stock-Yard Sun published my bloghe Stock.Yard Sun published my blog aphy in full, with portrait." Mr. Berkenhead stiffened perceptibly. "I am not a candidate for office," he said

BUT FEW NEW CHARTERS

WHEAT EXPORTERS AND SHIP. OWNER AT A DEADLOCK.

Nitrate Freight Near the Highest Point on Record-The Jetty Improvement.

Nearly a month has elapsed since a grain ship has been reported under en-sagement for Portland loading, but in spite of this apparent duliness, rates seem to hold as firm as ever, owners refusing to accept less than 45 shillings. The shortage in the California crop caused a slight weakening in San Francisco about a month ago, and one or two ships were taken at 358 6d. They were on spot. however, shid to take in ballast, pay towage and pilotage expenses to go to another port would have probably cost them enough additional to make the rate shilling. Two other salps which were in the Bay City at the same time refused STa 6d, and were charitred a few days ago at 38s 5d. While considerable will de-pend on the course of the market during the next six months, the statistical postion of freights has seldom been stronger than it is at the present time. Never before in the history of the ship-ping business in this port has 40 shillings and upward failed to start a considerable amount of tonnage in this direction

'secking. Rates have been above 40 shillings for over four months, and during that period not to exceed three or four disengaged ships have been headed in this direction, and even these were taken up long be-fore they reached here. The big demand for steam tonnage for transport service has, of course, been a great factor in booming freights, but there are other reasons for the advance. The demand for sail tonnage for nitrate loading has never been so great as at the present time, and the highest rates on record are being paid. The British bark Frincipality, which has carried at least half a dozen cargoes of Oregon wheat to Europe, has been chartered to load nitrate at a west coast port for the United Kingdom, at 37s 6d. As the nitrate ports are 6000 miles nearer the European markets than Oregon and Washington ports, and the port expenses are lighter than they are anywhere else, owners have always been willing to take 10 shillings less than was demanded from orth coast ports.

Based on nitrate freights as they are quoted at present, 45-shilling ships are apparently very reasonable, but at the same time, the uncertainties regarding the farmers' disposition to hold are such that exporters will not take hold of ship until they are forced to.

SHIPBUILDING IN UNITED KINGDOM Slight Reduction Compared With

Same Period in 1805.

From the returns compiled by Lloyd's Register of Shipping, it appears that, excluding warships, there were 40 vessels of 1,200,313 tons gross under construction in the United Kingdom at the close of the quarter ended June 30, 1900. Of these there were 436 steel steamers of 1,243,30 tons, 35 iron steamers of 6061 tons, and two wood and composite steamers of \$70 tons, making a total of steamships 473, having a gross tonnage of 1,20,838 tons. Of sailing vessels there were 25, viz. eight steel ships of 1230 tons, and 18 wood and composite craft of 2105 tons. Com-pared with the corresponding period of 1899 these figures show a decrease of 69 in the number of vessels under constructions and 121,054 tons in the gross tonnage The return, however, shows an increase in the tonnage under construction of about 5000 tons, as compared with the figures for last quarter, but a reduction of about 135,000 tons as compared with the unprecedentedly high total which was reached in December, 1598. Of the

Kingdom owners. In looking at the size of the wessels now being built, we find that the most popular ship is that between 3000 and 4000 tons, of which there are no fewer than 91 steamers and two sailing vessels. There are, besides, 50 vessels between 4000 and 5000 tons; 19 between 5000 and 6000 tons: 18 between 6000 and 7000 tons; 7 between 7000 and 8000 tons; 2 between 8000 and 9000 tons; 5 between 9000 and 10,000 tons, and 15 of 10,000 tons and above With regard to the warships under con-

struction in the United Kingdom, we find that there are for the British Admirally 54 fighting craft of 365,550 tons, for the British Navy. There are in addition under construction for foreign powers, or not stated, six armored vessels of 57,540 tons displacement, one protected cruiser of 4165 tons.

STAGING OF SHAKESPEARE.

Mr. Beerbohm Tree's Defense of the Public Taste. Fortnightly Review.

"Sir," said Dr. Johnson, "I have not even mentioned 'Little Davy' in the pref-ace to my Shakespeare." "Why?" ventured Boswell. "Do you not admire that great actor?"

"Yes," replied the doctor, "as a poor

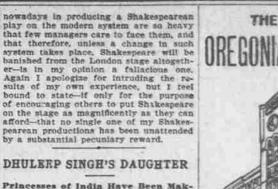

player who frets and struts his hour upon the stage-as a shadow." "But." persisted Boswell, "has he not brought Shakespeare into notice?" At this the immortal lexicographer fired

up. "Sir, to allow that would be to lam-poon the age. Many of Shakespeare's plays are the worse for being acted." Then Boswell, Scotchman that he was once more replied with a question. Is nothing gained by acting and decora-

"Sir!" replied Dr. Johnson, breathing hard; "Sir!" he thundered, as he brought down his fist with all the energy of his rotund and volcanic personality; "Sir!"and for once there was a silence-the only silence that is recorded in the life of that masterful personality. In this brief conversation is raised the

chief question which has divided lovers Ought his works to be presented upon the stage at all? Strange as it may seem in an actor, I am bound to say that I can understand this attitude of mind, which was shared by many thinkers of past ages. I am not astonished even that such acute and genial critics as Charles Lamb and Wordsworth-that such serious lovers of Shakespeare as Hazlitt and Emersonheld the opinion that the works of our we are told that under the present sys-

tem it is no longer possible for Shakes-peare's plays to be acted constantly and in their variety, owing to the large sums of money which have to be expended, thus necessitating long runs. Of course, if a large number of Shakespeare's plays could follow each other without intermis-sion, a very desirable state of things would be attained; but my contention is that no company of ordinary dimensions world. could possibly achieve this, either worthily or even satisfactorily. Leaving out of consideration for the moment all such questions as rehearsals of scenery and effects, it is impossible for one set of actors properly to prepare one play in the space of a few days, while they are play-ing another at night. Those who have had any experience of rehearsing Shakespearean drama in a serious way will bear pearean drama in a serious way will bear me out that a week or a fortnight, or even a month is insufficient to do the text anything like full justice. And even when attempts of this kind have been made, can it honestly be said that they have left any lasting impression upon th mind or the fancy? I contend that great er service for the true knowing Shakespeare's works is rendered by careful production of one of these plays than by the indifferent-or, as I believe it is now fashionably called, the "adequate"-representation of half a dozen of them. By deeply impressing an audience and making their hearts throb to the beat of the poet's wand, by enthralling an audience by the magic of the actor who has the compelling power, we are enabled to give Shake-speare a wider appeal and a larger fran-

ing a Tour of the World.

New York World.

The Princess Sophia and Bymba Dhu cop Singh, daughters of the Maharajah Dhulcep Singh, the warer of the g cat est name in the nobility of England's In-dian empire, arrived at the Waldorf-As-toria on Friday night. The Princesses came from Chicago

their way to their home in England, af er miking a tour of the world. They wer-accompani d by a single attendant, a tall Eng ish woman, who acts in the capacity

of companion. The artival of the princesses attracted so i't is attention at the hotel that their presence was hardly noticed. They ar-

rived lat, and went di celly to a spin-did suite of apartments that had been re-served for them on the sec nd floor fronting Fifth avenue. They did not appear in public on I late in the afternoon, when they went out for a drive, and returned at 5 o'clock for dinn:r, which was served in their apartments.

When a World reporter sent up his card to the Prince ses last evening a note was returned politely regreting that they were on the point of departure and could

receive no visitors. A written request for information re-garding the object of their visit was responded to by a card on which was written in a fashionable English hand, 'Just

came here to see New Yors and on the way back to England." A few minutes later the Princersey accompanied by their English atterdant

descrided from their apariments and en-tered a couch, in which they were driv a to the Bultimore & Oh's depot to take a train for Washington. The Princes is are little, slinder wom-n, with dark, aguil no feature and lut-

trous black eyes. Ho h were simply but tastefully clad in dark at ped allk trading os umas, with strue sal or hats a m-ply trimmed with fowers. It was originally their intention to spend

some days in New York, but last night they changed their minds and deterrane i to pay a visit to the National cavital. They expect to return to New York in time to sail for England Wednesday. In the veins of the Princess S phin Dhuleep Singh and the Prince's Bam's time Dhuleep Sinth runs the bl ol of one of the proudest potenties of the earth. They have been born to the most exilted position in all India, and to limit e a wealth. They are making the tour of the world chiefly that they may return as thorough worren of the world, and also that Princess Sophia may be benefited in

health. The Princerses are each less that to

years old. Dhulkep Singh is the represen-tative of one of the oldest families in India, which, previous to the English oc-cupation, was reckoned richest among all the Oriental potentiter. The family waged relentless warfare

against the British newcomers. Princy Dhuleep Singh took up the fight and fought on for years. But England at last whiped Dhuleep Singh's armies and cap-

last succeeded in preparing synthetic glu-cose from materials obtainable in the la-The last 15 years has brought forward the development of a practically new field of chemical work, which is at present termed physical chemistry. This portion of the science concerns itself chiefly with the intermediary ground lying between physics and chemistry, and, although the history of its later development has been brief, it already has many notable achievements to its credit. Its future work concerning electrical problems close iv allied to chemistry and the elucidation questions appertaining to solution will vitably have a wide practical bearing, a influence of physical chemistry already is being felt in many branches of technical industry.

pyrine, antifebrin, phenacetin and a host

The strides taken by the chemical in-ustries, based upon the exhaustive theoretical knowledge obtained by years of inhoratory development, have been mar-velous. Within the limits of this brief article it is not possible to enumerate the smallest proportion of their progress. Apart from the subjects mentioned above. dern chemistry has revolutionized the manufacture of explosives, glass, soap, paper, alloys and cement. Metallurgy is on an entirely different footing, and the process of electrometallurgy has become one of the most important industries in existence. Beet-sugar production has been developed almost into an exact science, and the various processes of fermentation and alcohol preparation have kept pace

with the rest. Physiological chemistry recently has advanced to a point where accurate results and close reasoning are possible, and the basefits derived from such substances as antitoxin cannot be overestimated.

The entire army of chemical investiga tors is moving forward today as been in the past. The future for the chemical industries is perhaps beyond our present comprehension, but in order for this result to be accomplished the founds. tion of technical advance must broad and deep in the firm ground of scientific research.

University of Michigan,

Display of Cowboy Hoodlumism.

Pendleton East Oregonian. At Lehman Springs a few days ago, a mpany of young men from Heppner ade the camp rather lively for a time, Heppner and sort of performed the bad-man-with a-gun act, by shooting at the stovenipes and otherwise manifesting a playfulness not compatible with the best breeding. In some manner, a number of young men from Pendleton and some from Heppner got into bad relations with each other. and the spirit of antagonism thus en-gendered caused them to form what looked like battle array, and threaten

to leave on the field of action both dead and wounded. No one was hurt, and the affair ended without any serious results. Broke a Thigh Stump.

FOREST GROVE. Or. Aug. 2.-Peter Harper, of Dilley, an elderly man, who had the lower third of his thigh ampu-tated several years ago, fell this morning, and broke the bone of the stump,

Collier Ashore.

has arrived here. Fire in a Lumber Yard.

MABINETTE, Wis., Aug. 9-Fire in the lumber yard of the Pol-ka Indus-trial Company at Crivitz today caused a loss of \$150,000.

WORK ON THE JETTY.

Repairs New Going Forward Rapidly at Fort Stevens.

work on the jetty at Stevens, under the direction of Superintendent Hegardt, is progressing at a rapid rate. Orders have been placed for over 1,000,000 feet of lumber, to be used in reconstructing the trestle, and several carloads of ralls have been ordered for use in relaying the track. The work is giving employment to a large number of aborers, and the new town of Hammond, which is close by the fort is receiving daily additions to its population. By the time a further appropriation is available, the plant and approaches to the jetty will again be in good order, and ready to handle the work of making permanent improvements.

ORIENTAL FLOUR TRADE.

Withdrawal of the Argyll Will Not Affect Matters at Present.

The war in the far East has had a se rious effect on the flour trade, and for this reason the withdrawal of the Argyll from the regular service is felt less than it would be at any other time. Advices from Hong Kong state that there are 1,000,000 quarter sacks of Oregon and Washington flour on the dock at Hong 1 000,000 Hong Kong, and 300,000 quarter sacks of Callfornia flour at the same port. Ship-

ments to the interior have almost ceased, and there will be but little improvement so long as the present conflict is raging. For the same reason there is a smaller amount of other freight offering

CEASES TO BE FREE PORT.

After the Year 1900 Dues Will Be Levied on Ships at Manchester.

MANCHESTER, Eng., Aug. 9.-Chair-man Bythell, of the Manchester Ship Canal Company, at a meeting today, in formed the shareholders that Manchester after the year 1900, would cease to b a free port; that ships' dues would be levied on a moderate scale, and that would be obliged to pay for shipowners borths for their ships.

Glenogle Clears for Japan.

TACOMA, Aug. 8.—The big liner Glen-ogie cleared this morning for Japan. There were only a few cabin passengers and about 20 Chinese in the steerage, but she carried 29,400 sacks of flour, mostly the product of Washington mills, des-tined for Japan and coast cities in China. In addition to the flour she has a great quantity of general store supplies. About 200 steel rail were taken to Japan te build driveway tracks in the mines.

Domestic and Foreign Ports.

ASTORIA, Or., Aug. 9.-Sailed at 10:40 A. M., British ship Harlech Castle, for Queenstown. Condition of the bar at i P. M., smooth, wind, north; weather, cloudy. Hoquiam, Wash., Aug. 7. - Salled-Schooner Lizzie Vance, from Aberdeen,

chise-surely no mean achievement. Thousands witness him instead of hundreds; for his works are not only, or pri-marily, for the literary student; they are when all else fails. Write today, for the world at large. Indeed, should be more joy over ninety-nine Phil elect that are gained than over one elect that is preserved. I contend that not only is no service rendered to Shakespeare by an "adequate" representation but that such performances are a dis-service, in so far that a large propor-tion of the audience will receive from them an impression of duliness. And in PORTLAND

that all modesty it may be claimed that it is better to draw mul-titudes by doing Shakespeare in in the way the public prefers than to keep the theater empty by only presenting him "adequately," as these counsels of imperfection would have us do. I take it that the proper object of put-ting Shakespeare upon the stage is not only to provide an evening's amusement at the theater, but also to give a stimulus the further study of our great poet's orks. If performances, therefore, make at a fleeting impression during the mobut a ments that they are in action, and are forgotten as soon as the playhouse is quitted, the stimulus for diving deeper into other plays than those that we have witnessed must inevitably be wanting. witnessed must inevitably be wanting. For my own part, I admit that the long run has its disadvantages-that it tends (unless fought against) to automatic act-ing and a lessening of enthuriasm, pas-sion and imagination on the part of the

actor: but what system is perfect? It is regrettable fact that in all the affairs of life, whenever we sirive for an ab-stract condition of things, we are api to come into collision with the concrete wall which is built of human limitations-as
