Portland, Friday, February 4, 1910.

THE PRESS ON MR. BRANDEIS.

The prominent note in all of the newspaper comment on the appointment of Louis Brandeis as Justice of the United States Supreme Court is surprise. That surprise springs solely from the character and past performance of the man, for in view of the present political composition of the court it was to be expected that President Wilson would name a Democrat. The same sentiment is expressed in the Democratic and Republican newspapers, by those which commend as well as by those which condemn the appointment.

Adverse criticism is based on the belief that a man who has been the ardent champion of certain lines of policy on questions which figure so prominently in the present political campaign is by that fact rendered incapable of taking the unprejudiced view of legal questions which is essential to a judge. No doubt is expressed as to Mr. Brandeis' ability, sincerity or integrity. His critics are simply skeptical as to his fitness for the position.

Those who defend this appointment say that it is opposed because Mr. Brandeis is an anti-conviction lawyer. It is an objection which is very same reason that the elevation to the Federal Bench of men who were classed as corporation lawyers has been condemned in the past by the men who now endorse the Brandeis appointment—that the associations and connections of the man are such as to impart unconscious bias to his views of legal controversies. The Supreme Court should be composed of men who are not biased either for or against any class or interest which may be concerned in appeals which it must hear.

But whether it be matters, garbage, slush or political interference in other departments, there is always a good excuse for duty. That staff about the commission charter fixing responsibility must have been a joke, so far as he is concerned.

JUST FOR STATUARY ORNAMENT.

The amazing information comes from Dr. Tufts that he is proposing a law which he does not expect to see enforced in all its provisions. In a letter published in another column he attempts to still criticisms of some of its features with the statement that "the history of the past fifty years of lax enforcement of such laws in Oregon should allay all fears of that nature."

THE WORLD'S GREATEST CITY.

By substantial agreement between estimates of the United States Census Bureau and the City Health Department, the population of New York City is approximately 5,460,000, and that city now claims the greatest population in the world. The two estimates are 5,461,000 and 5,459,000. The state census of 1915 showed a smaller total, 5,047,221, but this includes only the persons entitled to political representation, omitting large classes of people who are not so entitled.

NEW YORK TAKES AN INTEREST.

In the statistics which it claims that the figures above given establish it in first place, ahead of London. The validity of that claim depends on the boundaries given to each city. If Greater New York be compared with the county of London, each within municipal boundaries, New York has made good its claim. The London County had in 1911 a population of 4,322,844. It may be contended by London's champions that this is not a fair comparison, since it gives New York credit for a large rural area on its outer edge, while London County is the center of the corresponding area. The Londoner contends that a fair comparison with Greater New York is Greater London, included within the metropolitan police area, which embraces the whole of Middlesex and parts of Surrey, Kent, Essex and Hertford. Of this area the Encyclopedia Britannica says:

Only here, and there upon its fringe, the density of the great area with the metropolis is lost to the eye, where some country is broken up by streets or forest plantations.

The population of this area in 1911 was 7,331,343, which puts it ahead of Greater New York in 1911, though the war has doubtless caused serious diminution. But the New Yorker retorts that London's outer ring includes the whole of the metropolitan area in the county of Greater London, and that the American metropolis should be credited with the latter territory in order to make the comparison just. New York would then have a total of about 7,330,000 and would have made good its claim. Again, New York has the land, and London has the people.

Next to London ranked Paris before the war with 2,838,110, while Chicago was fourth with 2,192,125, but the war has seriously reduced Paris' population and has probably lowered it to

fourth place. Petrograd was fifth with 2,209,000, but has probably lost as heavily as London, Paris and Berlin. The last-named city had 1,991,494 at the outbreak of the war, but on January 19, 1918, was reduced to 1,377,569, having gone further below Tokio, which has 2,925,321, and Vienna, which had before the war 2,921,438. A new count all around after the war will doubtless show some material changes.

FASHIONS IN SCHOOL INSTRUCTION.

The Evening Telegram has an elaborate report of an investigation conducted by a local physician, Dr. Edmund Myers, to test the efficiency of local school instruction. Dr. Myers prepared a list of questions, thirty-one in number, of a grade school. The subjects were covered in the ordinary textbooks. The percentages of correct answers were: Spelling, 53.7 per cent; geography, 24.7 per cent; grammar, 51.96 per cent; arithmetic, 45.61 per cent; history, 46.7 per cent; civics, 46.72 per cent.

Our contemporary appears to have formed the opinion, as a result of the Myers inquiry, that school methods in Portland are defective, that there are "too many frills" and that Superintendent Alderman is to blame. But it may well be asked how the tests are conducive of anything as to the Portland schools that is not common to all public schools. It may be recalled that a similar inquiry recently into the knowledge of current events by students of three great Eastern colleges disclosed most deplorable ignorance. It is a fact that the Portland school system is not different from the educational plan adopted in all American cities. It differs only in detail. Fundamentally it is the same—a vast enlargement of scope so as to cover many things, evidently with the notion of teaching the young idea how to shoot in every conceivable direction. Primary studies—the old-fashioned reading, writing and arithmetic—are lost, or at least are relatively less important than they were. The multiplication table is an incident and not a landmark, or a milestone, or a signpost. The ever-changing curriculum is particularly displeasing with the "boosters" who were responsible for Letter-Writing week, and he takes occasion to declare that industrial conditions here are not good, and to intimate that anyone who has money should get out of Oregon. It was in his pocket rather than in his head that he would like to see the "boosters" who were responsible for Letter-Writing week, and he takes occasion to declare that industrial conditions here are not good, and to intimate that anyone who has money should get out of Oregon.

FRIEND DALY.

A newspaper apologist for Mr. Daly excuses the disgraceful condition that prevailed in the downtown streets for twenty-four hours with the intelligent and pointed observation that Mr. Daly did not make the weather.

Quite right. He did not. Nor does the fire department start fires. The fire department are ready to excuse the fire department for possible delinquencies in combating conflagrations they will be ready to excuse Mr. Daly's street department for failure to combat the storm.

What the people thought of the proposition to remove the ash from the streets is pretty accurately set forth by the same Daily newspaper apologist. It is possible that on Wednesday evening it had not yet discovered who was responsible for the condition. At any rate, it then published the following in large headlines:

One of our shrewd leaders... has been removed from office. Apparent lack of ability and capacity are blamed for present condition.

INTENSE INDIGNATION.

Intense indignation prevailed throughout the business district because of the effect on the part of the city administration in getting the streets so filthy on crossings and in gutters.

But whether it be matters, garbage, slush or political interference in other departments, there is always a good excuse for duty. That staff about the commission charter fixing responsibility must have been a joke, so far as he is concerned.

THE BULL IN THE CHINA SHOP.

Rough, unpolished, outspoken men have their place in the world. They may even rise to the dignity and stature of great statesmen. But as diplomats how hopeless they must appear. The diplomat must be skilled in verbal fencing. He must be able to say a great deal without meaning anything or to mean a great deal without saying anything, all according to the requirements of the particular situation that may confront him. Diplomacy is a polite art for which one must be equipped by temperament as well as by practice, for great crises may hang upon the ingenuity, tact and skill of an individual diplomat.

INDIGNATION AND DIVORCE.

Wives have been given much advice on how to keep a stranglehold on husbands' affections. Some matrimonial experts assure them that the one certain way is to study the animal and pander to his whims. If he has a weakness for the club, install a clublike atmosphere in the home. Some women have taken a more vigorous stand and sought to break club-loving husbands of their club by use of a club in the primitive meaning of the word. Perhaps they have met with a greater tender attention than their more tender sisters. A vigorous woman with much

determination and strength of character rarely loses her husband or permits him to go very far astray.

But we are now assured that all these refinements of little consequence unless the brute is plied with wholesome viands. The value of good cooking as a factor in domestic felicity has been recognized since matrimony was first devised, but it is seldom that an expert observer of the matrimonial phenomena goes so far as to write in the current Farm and Fireside. Conjugal bliss and digestible meals are one and inseparable, it appears. While burned potatoes and divorce go hand in hand.

This may be a wholly true, yet there is room for more than mere surmise in such a theory. Improperly cooked foods are not readily digested. Undigested food generates toxins, which, added to the normal poisons of waste and fatigue, surcharge the blood with brain irritation. Brain irritation causes much of the distemper and strident abuse which mark the unhappy type of home. A man or woman who is suffering from an undigested breakfast will exhibit irascibility which might never appear had the stomach been properly cooked. It would be interesting to know how much marital discord has been caused by indigestion and, thus, how many divorces have been the direct result of a wifely inability to cook the family meals properly. Still, good cooking may encourage a man to eat the same result. Woman has been accused of the blame for nearly all trouble, ever since Adam started the custom. So we guess she will not notice the added burden of responsibility for the divorce evil.

MISREPRESENTING OREGON.

The Oregonian has received from several sources copies of Eastern papers, containing an article written by a dissatisfied rancher of Southern Oregon, with the intent of warning all good people to keep away from Oregon. The author is particularly displeasing with the "boosters" who were responsible for Letter-Writing week, and he takes occasion to declare that industrial conditions here are not good, and to intimate that anyone who has money should get out of Oregon. It was in his pocket rather than in his head that he would like to see the "boosters" who were responsible for Letter-Writing week, and he takes occasion to declare that industrial conditions here are not good, and to intimate that anyone who has money should get out of Oregon.

It has been stated a thousand times, and more, that the purpose of Letter-Writing week was to call the attention of the traveling world to the scenic and other wonders of Oregon. It was concerted effort to place Oregon on the tourist map, and there was no plan and no desire to appeal to any other class of people. Yet a consistent effort has been made to misrepresent the whole project, as, for example, the pessimistic outpouring of the displaced farmer. The article omitted and the indemnity reduced, the latter will nevertheless be black-mail. The treaty should be rejected for this reason and for the further reason that it grants Colombia privileges in the Panama Canal which President Wilson has said that the United States could not enjoy, as owner of the Canal, without violating the Hay-Pauncefote treaty. If we cannot enjoy them, how can we grant them to Colombia?

HOW WOULD YOU LIKE TO BE HOMELESS?

How would you like to be homeless and footless in this weather? Consider the possibilities and thereby gain some idea of the unhappy fate of millions of innocent non-combatants in Poland. Incidentally, it might be well to recall that there is a fund being raised to alleviate this suffering and that you are eligible to contribute.

SCHENECTADY HAD AN EARTHQUAKE.

That three sleepers from their beds, and publishes the fact. If such were a common occurrence, Schenectady, like San Francisco, would seek other means of glory.

IN JAVA A FLOOD DESTROYS 120,000 HOUSES.

In Java a flood destroys 120,000 houses; in Oregon snow causes some temporary discomfort and inconvenience. But we are in Oregon, and Java is a long way off.

IT IS TO THE INTEREST OF THE UTILITIES COMPANIES TO RESTORE SERVICE AS QUICKLY AS POSSIBLE.

It is to the interest of the utilities companies to restore service as quickly as possible and that is what they are doing. Patience and cheerfulness assure longevity.

REGISTER NOW!

Register now! An unpleasant duty, to be sure, but milder than doing your Christmas shopping early, of which necessity you again will be reminded shortly.

There is more joy in Germany over one British ship captured than over ninety-nine German ships which of course capture by internment.

How to Keep Well

How to Keep Well. By Dr. W. A. Evans. Questions pertinent to hygiene, sanitation and prevention of disease, in matters of general interest, will be answered in this column. The subject is not suitable, letters will be personally answered, where possible, and a copy of the issue containing the answer is enclosed. Dr. Evans will not make diagnoses or prescribe for individual cases. Requests for such service cannot be answered. Copyright, 1910, by Dr. W. A. Evans. Published by arrangement with Chicago Tribune.

A STATE WITHOUT CONSUMPTION.

Dr. Victor Heiser, director for the East of the International Health Commission, is responsible for the statement that the state of Victoria, Australia, has entirely eliminated consumption from among its people. His statement in the Journal of Outdoor Life is:

"I have recently been advised that the enforcement of these rules in the state of Victoria has resulted in the disappearance of tuberculosis." Dr. Heiser is an amateur in sanitation. For years he had charge of sanitation in the Philippines. He is now high in authority in the International Health Commission. Having heard of the situation in Australia, he went there representing the commission to get first-hand information. His statements, therefore are worth your attention.

What are the rules to which he alludes? Any one reporting a case of tuberculosis is paid \$100. In this way the state is kept informed of all cases. As soon as a case is reported an investigator calls. If the case is one that should be hospitalized, it is put in an institution at once. If the sick person is in a position to carry out all the rules for the protection of the people he is given the option of remaining in his home, if the law is that every case of consumption is to be cared for in a hospital or sanitarium. If the patient desires to remain at home, the state medical authorities that he is willing and able to carry out instructions he is allowed to remain at home.

He furnished a card on which are printed certain very definite rules. He must sleep on a porch which has been approved by the inspector. He must care for his spittoon and his individual knives, spoons, etc. The inspectors inspect regularly. If two violations of the rules are proved the patient goes to a sanitarium or hospital without any formality. He is kept there until there is no longer danger that he will infect any one.

In order to protect the people against the spread of tuberculosis, the state maintains a system of sleeping out. The custom of sleeping out is well-nigh universal in Victoria. In Victoria the measures which succeeded in eliminating tuberculosis from Victoria in a single generation. They are simple enough, but more important than the rules which are followed there is obedience. The law is the law and nobody is above it.

Australia has a low death rate and Victoria is one of the healthiest states in the group. The people are of good stock. They are young and strong. They are fond of out-of-door exercise and try to keep their bodies fit. The climate of the citizen falls in the life period where there is not much sickness and the danger of death is not great. The climate of Victoria is fit for the health of the citizen. The health of humans so well thought out as in Australia. Nearly was the mythical land of the story of the golden age. It is a crime punished by law, sickness was a crime punished by law.

CONQUERING NICOTINE.

Conquering Nicotine. M. R. H. writes: "How long does it take the organs to get accustomed to perform their functions without tobacco?"

THREE TO SIX WEEKS.

CHANCES ABOUT EVEN.

F. R. writes: "I would greatly appreciate your valued counsel as to the advisability of marriage with an apparition of a woman who is a devotee of the following standpoint: 'The girl's father, now deceased, and the father's brother, now living, are both afflicted with a disease diagnosed as Huntington's chorea. I. What are the chances that the daughter will become so afflicted, and that of her offspring?'"

WHAT IS THE NATURE AND CAUSE OF THIS DISEASE?

1. The chances that she will develop the disease are about even. 2. The chances that some of her children would develop the disease is very great. 3. The chances that some of her children will not be able to develop the disease. The genetics law of Huntington's chorea should not beget children. About half of their children develop the disease. If the parents are both afflicted with Huntington's chorea, the chances are that some of their children will be afflicted with the disease. 4. The chances that the disease will be inherited by the offspring. 5. The chances that the disease will be inherited by the offspring. 6.
