WHAT SCIENCE HAS DISCOVERED ABOUT YELLOW FEVER

ITS GERM WAS ISOLATED BY AN ITALIAN BACTERIOLOGIST. MEANS TO PREVENT SPREAD OF THE DISEASE A A

people in the City of New Orleans, together with the spread of the disease in the Crescent City, causes general in-

terest in the dreaded "yellow plague." New Orleans and Memphis have, for the past 100 years, been the chief suf- | geon in the United States Army, published ferers from this disease. Many other Southern efties have also been sorely afflicted with the terrible scourge.

In 1889 there was a general outbreak of yellow fever in the South, and Section for the parasite of yellow fever, retary of the Treasury Gage issued an abstract of a report of medical experts who were appointed by the President and instructed to investigate the cause of the disease and its etiology.

Yellow Fever Germ.

The commission consisted of Sur-

investigation. The report embodies the work of the commission in fairly testing the claim of Professor Sanarelli, of Bologna, Italy, that the bacillus icteroides is the cause of yellow fever, and the con-clusion is drawn that this famous sci-entist has isolated the true cause of the scourge. The conclusion is based upon a careful bacteriological study, in a well-equipped laboratory in Havans, of 22 cases of disease thought to be yellow fever by the native physicians in attendance.

Of the well-known facts connected with the epidemiology of this disease, and, of course, by the brilliant work of Ross and the Italian observers, in connection with the theory of the propagation of malaria by the mosquito."

A feature of the report of the medical

Of the 14 cases diagnosed as vellow an independent observer for whom tube cultures had been taken at a necropsy conducted by the commission. Thus the even percentage of iso-lations has been obtained in these 14 ism of Sanarelli was not obtained,

From the living blood in 12 of the 14 cases, abstracted not earlier than the third day of the disease, the organism was isolated, and in the two termined.

Dr. Lazear was collecting blood from yellow fever patients for study in Las Animás Hospital, he was bitten by a culex mosquito, whose variety has been undetermined. others it was obtained postmorten. The commission, having preserved a num-ber of cultures made at the isolation hospital in the City of New Orleans from cases seen during the epidemic of 1897, also isolated therefrom the bacil-lus icteroides in the proportion of 83.22 per cent of the cases examined, the having been made at Thus the identity of the bacilius icteraides of our Southern States with that found in Cuba and that sent the commission by Professor Sanarelli, which was obtained in South

Study of the Germ.

The commission also examined 31 unknown dead bodies found in Cuba, and in all cases wherein the death had been caused by disease other than yellow fever none of Sanarelli's organ-isms was discovered. Many experiments were made with animals and the natural history of the newly discovered germ was studied. It was found that when animals were placed under natural conditions of infection the test proved conclusively the natural specificity of the organism of San-

The theory formulated and expressed Surgeon-General Sternberg, that "germinal principle" in yellow er was to be looked for in the alimentary tract, an opinion evidently de-pendent upon the well-known influ-ence of the disease upon the organs adjacent and contributive to this tract and portions of the tract itself, as the duodenum, has been found untenable by the commission, since there is no record of anyone ever having isolated he specific germ from the canal save its presence there through some capil-lary hemotrhage into its lumen.

The influence of the various disinfecting agents upon the bacillus icter-oides has been studied by the commission with an eve to the practical advantages to be derived from a better acquaintance with the organism, and it is found that the organism is readily influenced by the mechanical and chemical agents in ordinary use. Cold. owever, is not a factor in this process for the organism resists the most ex-tensive refrigeration, and no reliance can be placed on this mode of disinfection. On the other hand, the organism is very susceptible to dehydration, and cannot withstand artificial drying for more than 10 to 12 days, and it is very that its susceptibility to front is due to the lessened humidity of the Sunlight is very fatal to this organism, and no doubt is more so if the organism has lost its vitality through evaporation of its fluids, as in a frosty atmosphere.

A Filian maiden desporately in

Important Conclusions.

The conclusions of the commission are as follows, and are regarded as being of great importance by the medical world, and may result in the production of an antiserum which will prove a potent cure for and preventive That the micro-organism discovered

by Professor Giuseppe Sanarelli, of the University of Bologna, Italy, and by him named "bacillus icteroides," is the cause

us to certain animals, the degree varying with the species; that in some rodents local infection is very quickly followed by blood infection, and that, while in dogs and rabbits there is no evidence of this esequent invasion of the blood, monkeys peact to the infection the same as man.

2. That infection takes place by way of the respiratory tract, the primary colon-ization in this tract giving rise to the arlier manifestations of the disease.

4. That in many cases of the disease, probably a majority, the primary infection colonization in the lungs is followed by nation of this organism in the blood of the patient. This secondary infection may be complicated by the coinstantaseous passage of other organisms into the blood or this complication may arise dur-ing the last hours of life.

That there is no evidence to support theory advanced by Professor Sanaelli that this disease is primarily a septimia, inasmuch as cases do occur in ich the bacilius icterpoides cannot be nd in the blood or organs in which is

That there exists no casual relation erg and this highly infectious disease that the bacillus "X" is fre mais and of man, as well as in the

That, so far as your commissioner is eare, the bacillus icteroides has never en found in any body other than one ected with yellow fever, and that what-

THE sudden appearance of yellow; in vitro, as well as in vita, a toxin of the | infection and with the results that folfever in the United States this most marked potency, and that, from our Summer and the death of many present knowledge, there exists a reasonable possibility of the ultimate production

of an antiserum more potent than that of Professor Suranelli.

Mosquito the Sinner. A year or so ago Dr. Walter Reed, suran account of a careful study of yellow fever by himself and other Army officers. The report mays in part:

and it is highly probable that the disease is only propagated through the bite of this

importance in the medical profession, par-ticularly as the Army surgeons had an ex-cellent opportunity to study the disease last Summer during the fever epidemic at Quemados and among the patients in Las geons Wasdin and Giddings, two ex- Animas Hospital, Havans. The discovery perts, who were detailed to make the of Dr. Reed and his assistants will be of great help in fighting the disease.

The Army surgeons say that they were influenced to give their attention to the theory of the propagation of yellow fever by means of the mosquito-"a theory first advanced and ingentously discussed by Dr. Carlos J. Finley, of Havana, in 1881 . . by reason of the well-known facts con

A feature of the report of the medical officers is that Dr. Jesse W. Lazear, one of the 1s cases diagnosed as yellow fever, the commission isolated the organism of Sanarelli, the bacilius leteroides, from 13, and in the case in which this organism escaped the observation of the commission it was isolated by the fever through the medium of the in-

One Actual Test.

In Dr. Lazenr's case he had been bitten on August 16 by a contaminated mosquito cases, all of which presented prominent symptoms of the disease. In the preciable disturbance of health followed cases not thus diagnosed the organ-

ten by a contaminated insect without after effects, he deliberately allowed this particular mosquito to remain till it had satisfied its hunger. Five days after the bite Dr. Lazear was taken ill with progressive and fatal yellow fever and died

The board's comment in this case is: while present in the wards of a yellow fever hospital, one must at least admit the possibinty of this insect's contamination by a previous bite of a yellow

fever patient."
Dr. Carroll was bitten by a mosquito, culex fasciatus, on August Zl. This par-ticular mosquito had bitten two severe and two mild cases of yellow fever before attacking Dr. Carroll. Five days after being bitten Dr. Carroll was down with severe yellow fever, from which he recov-

Conclusions of Surgeons.

The medical officers say in conclud-

lowed the bite of the mosquito in these three cases. Our results would appear to throw new light on Carter's obser-vations in Mississippi as to the period required between the introduction of the first (infecting) case and the oc-

"Since we here, for the first time, record a case in which a typical at-tack of yellow fever has followed the bite of an infected mosquito, within the usual period of incubation of the disease, and in which other sources of infection can be excluded, we feel con-fident that the publication of these observations must excite renewed interest in the mosquito theory of the propagation of yellow fever, as first

roposed by Finley.
"From the first part of our study of yellow fever we draw the following

"I. The blood taken during the life from the general venous circulation, on various days of the disease, in 18 cases of yellow fever, successively studied, has given negative results as regards the presence of bacillus icteroides

Cultures taken from the blood and organs of 11 yellow fever cadavers have also proved negative as regards the presence of this bacillus. "2. Bacilius icteroides (Sanarelli) stand in no causative relation to yellow (Sanarelli)

fever, but, when present, should be considered as a eccondary invader in this disease. "From the second part of our study

The mosquito serves as the intermediate nost for the parasite of yel-low fever, and it is nighly probable that the disease is only propagated through the bite of this insect."

of yellow fever we draw the following

Wood's Feat at Havana,

General Leonard Wood stamped out the yellow plague at Havana, after it had been carrying thousands to the grave for hundreds of years. His watchword was sanitation. These facts are an open book to the American people.

In this generation we consider yellow fever as a plague liable to harry the Gulf states only, but epidemics of the disease in the North are not unprecedented. In 1793 Philadelphia had a visitation of yellow fever, the effect of which was more appalling than that of any modern epidemic. The Summer of 1792 had been unusually hot and The sanitary condition of the city was extremely bad, and the pools formed by the coplous rains were with filth, which sonked into ground. The succeeding Winter was unusually mild, hardly any ice was formed and the frost did not penetrate into the ground. The Summer of 1793 was hot and dry, and the burning

sun drew up the minematic exhalations from the parched and polluted ground. About the middle of July an epidemic broke out in the quarter on the river front resorted to by seamen. Ships from Santo Domingo and other West India poris were lying at the wharves. For a time the disease, though extreme-ly fatal, was confined to this section of the city and no general alarm was felt. But during August the disease "For ourselves we have been pro-foundly impressed with the mode of the whole city was involved."

WHERE GIRLS MAKE LOVE QUEER CUSTOMS IN SOME LANDS BY WHICH MARRIAGES ARE CONTRACTED

THE students of phychology and so-clology know that women have cul-tivated an attitude of effeminate coxtivated an attitude of effeminate coyness along with the thousand and one conventionalities that have been thrust his wife, and his sister if she remonon them. In spite of these opinions, says the Chicago Tribune, in the days gone by it was almost as common for the women as the men to do the courting. Today there are parts of the world where young women feel they are doing nothing wrong by taking this pleasure

and responsibility on themselves. In Polynesia there are no women's clubs and the doctrines of woman's rights have never been heard, and still these half emancipated young girls feel they have the right to extend an offer of marriage to an equal or to an inferior. Their proposals are sometimes love is unanswered they do not commit suicide or take poison, as an American atmosphere at such seasons, rather than to the degree of cold experienced. novelist might make us believe. They

> A Pijian maiden desperately in love with a young man asked his father if she might love his son, and receiving no encouragement, she said: "Let me only live outside of his

> ome. I will sleep upon the woodpile. If I may only light his cigarette for "I may only hear his voice from a distance; it will suffice. Life will be

pleasant to me. Batween the northern and southern extremity of New Guinea lies Torres Strait. The largest island in the strait toms are insular and unique-they are of special interest to students occopied with the phenomena of love and marriage Papuan type, frizzled-hair people, cultivate the soil, use the bow and arrow, and, un-Australian like, treat the

women with consideration.

Professor A. C. Haddon, the most em nent authority on these people, says that dependent. The most a man ever dares is to suggest he is fond of a girl, but if he actually proposed, he would be the laughing stock of the whole district. On

"You no like girls first; if you do girls laugh and call you woman." When a girl likes a man, she tells his sister and gives her a ring of string. She tells the brothe she has some good news for him, and if he approves they select a rendezvous, where the conversation is carried on in

"You like me proper?" "Yes," she declares. "I like you prop-er, with my heart inside. Eye along heart see you—you my man." Half frightened, he continues: "How

you like me?" She usually answers: "I like your legyour skin good. You my man." In a neighboring island courtship assumes a more practical form. The lovesick maiden sends her young man food and plenty of it. He waits some time, and if he decides he approves of her he acknowledges her favor by eating all she has sent him. A good dancer is always admired in these islands. A mun's being married does not prevent his being court-

husbands when married-sometimes to the extent if a man gets angry, he kills

In New Zealand women do their courting in a most romantic fashion. The visits the courting-house set apart for this purpose. Standing up in the dark she says: "I love So and So and I want him for my husband," whereupon the chosen lover, if willing, mays "Yes, or enough to signify assent.

The Pueblo girl is even more independ-

ent; after many a delightful and sometimes romantic flirtation she comes to the conclusion she is fonder of one suitor than the others and she tells her father she is determined to have the young man. The father usually acquaints the young man with the fact. It seldom happens that any objections are raised, but the father of the bridegroom must reimburse the parents of the maiden for the loss of of presents in keeping with their wealth

The young people are thoroughly inde-pendent, and if they learn they do not love each other as much as they imag-ined they separate and leave their chil-dren to be cared for by the grandparents. The Mogui girls are so strennous in their love affairs they are satisfied with a verbal contract. Goods, personal effects and valuables of the women still belong to them. If a woman leaves her husband she takes all with her. The husband is this keeps them together where otherwise divorce would ensue. Among the Spokane Indians when the man falls in love he must consult the father of the girl, though it is more usual for the girl to make the advances. They usually marry from the same tribe, but if a man marries out of his tribe he must join his wife. It is thought she can work better in a

country that is known to her.

The indian girls of the Hudson, according to several reliable authorities, signify openly their desire for matrimonial life. When one of them takes a notition to marry she covers her face with a veil and sits covered as an indication of her desire. If she attracts a suitor negotiations ensue, presents are given by rela-tives and friends and the bride taken. tives and friends and the bride taken. A pretty girl. Manjiknawis ebe was called, was fond of a self-contained, egotisticol young man who had no special fondness for her beauty. She had a notion that her ability as a housekeeper might win him though her beauty did not. She was solicitous in attending his wants, mended his moccasins and prepared his food, but he was equally indifferent to these kindnesses. So she resolved to play a trick. She dug a hole in the spacious lodge and covered it carefully. When the young man returned from the chase he threw himself down in the usual place and fell in.

the usual place and fell in.

"Ha, ha," said the girl, as she helped him out. "You are my prisoner at last. I more amused by the inventive mind, he said: "So be it. I will be yours."

Watkin Mills, the eminent English asso, now touring in Australia, recently had a weird experience in the gold fields of Coolgardie. His concert party went one day, at the invitation of an official. married does not prevent his being court-ed again. Girls have enough tact not to they were down in the bowels of the earth make this known to the wife. A sister is it was suggested by some one who knew characterized by a specialty which is tinctive.

I aut the bacillus interested is very septible to the influences injurious to distinct its are weatherfully persistent. Hadden tells of a girl who was in love with a cook. Eleventh Annual Meet

As soon as the singing was begun the miners trooped from all directions, carrying lights in their hands, to the spot where the singers stood, and it was a strange, uncanny sight to see them standing silently around, their begrimed faces lit up in the giare of a hundred candles and their bodies thrown into the shadow of their uplifted arms. Mr. Mills is a great lover of humanity, and his sympathies with the hard-working miners, who looked almost spectral as they streamed softly from the subterranean passage, made it a real pleasure to him to entertain them in this way.

LIFE ON TORPEDO - BOATS

Crew Suffers Much in Hot, Cramped Quarters in a Heavy Sea.

Norfolk Landmark. Each of the torpedo craft carries a rew of from 60 to 79 men, and when one considers the size of the space in which it is necessary for these men to move about in operating the powerful

yet intricate machinery, and find sleeping space also, one must marvel at the life aboard a vessel of this class. To live in quarters the size of an or-dinary dry goods box is not the life that the everyday American citizen cares to essay. To endure such life for hours at a stretch, without sleep, and to stand exposed in all climates—such is life aboard a torpedo craft for officers and men alike.

There is no discrimination; that is why one sees beardless faces and slen-der figures behind the conning-towers when these long, three and four-stacked fliers run into port for coal, and water at frequent intervals, which is neces-sary on account of their limited space for carrying these necessities. In the comparatively smooth waters of this harbor the torpedoboats look very much

conning-tower, and the crew lounge on deck, but when the little craft begins to roll and plunge in the seaway the hatches are closed, find, barring the stumpy smokestacks, the vessels reemble baby whales at play. It is then that the crew suffers most while at sea.
All must remain below decks or place
themselves in jeopardy. To venture
above while the vessel is plunging
about the sea with decks awash would

about the sea with decks
be extremely hazardous.
Sometimes the Japanese steward will
essay to climb along the deck from the
stern to the forward hatch with a
stern to the forward highly in his smoking dish clasped tightly in his hands. He is in a race with the seas. If he reaches his destination forward he is lucky. If the seas get there first, the fishes get the food,

In the event of the seas overtaking him there has to scramble head to

him, then he has to scramble back to the galley and await another chance. This is an amusing incident of life aboard, to watch the steward essay the trip in rough weather.

Intense heat prevails below decks when the craft is under way with hatches closed, and the humidity is one of the inconveniences to which the crew of a torpedo-boat is subjected, and is one of the most objectionable features of life aboard the torpedo craft, as the heat is oppressive and fearful at times, with all four boilers under full draft and ponderous engines throbbing and pulsating at full speed of perhaps 25 to 30 knots.
