Sernia is the brother of 21 girls and three boys and has been married twice. He is 62 years old, while his wife is but 20. Notwithstanding her youthfulness, she is the flocker of 2 wand to be probably not least, but signed to preserve the beauties of the beauties of the depended upon to produce plenty of eggs at all seasons. The chicks are hardy, make rapid and vigorous growth and are desirable for market at all ages. The fowls should weigh from 7½ to 8½ pounds for males and from 5½ to 6½ pounds for males and from 5½ to 6½ pounds for males and from 5½ to 6½ pounds.

Notwithstanding her youthfulness, she is the mother of five children. Sernia has been married 25 years.

Modern Poultry Culture

EASE.

One of the worst diseases of young chicks is Coccidiosis, commonly called white monly called white diarrhea, which is widespread and infectious. The younger the chick the more liable is it to die from the disease. It is very important, therefore, for poultry keepers to know the best means of protecting chicks against this disease.

BY PROFESSOR JAMES B. MORMAN. Former Expert for the United States Department of Agriculture.

Miss Thompson's room has the honor of reporting the highest per cent of attendance for last month.

The women's club of the Wisconsin Society Wednesday night gave a benefit performance of "The Old Maids' Convention," for the emergency fund of the Parent-Teachers' Association. Pupils from the grades who assisted in the programme were: Dorothy Snider, Mary Louise Cochran, Geraldine Root and Kathryne Snider.

Former Expert for the United States Department of Agriculture.

Department of Agriculture.

Agriculture.

HOUGH it is not generally known. It is the death of chicks from white diarrhea, the disease survive, they are so weakened that they fall an easy prey to aliments which would easily be resisted by chicks with normal health and vigor.

With a disease so weakening and so fatal in its effects as white diarrhea, every precaution should be taken to protect the flock against its ravages. It

Since the yolk forms-the nourishment

soil contaminates either the food or the water, so that the spores of the parasite are swallowed by other chicks, they also become affficited with the disease.

The spores, or cysts, are resistant forms of the parasite. They pass with the excrement of an infected chick. If some cysts are swallowed by a well the excrement of an infected chick. If some cysts are swallowed by a well they cannot be able to determine whether all his lowls are free from white diarrhoea or not. Nevetheless, it is a safe course to select for the production of hatching the with food or water, they remain unchanged until they reach that part of the digestive tract called the duodenum. Here the spores escape from the cyst and attach themselves to fite cells of the intestines, which they finally penetrate. Once inside, the parasite grows rapidly at the expense of the cell it has invaded. The life cycle of the spore is completed in about eight days.

In soil contaminates either the food or the spores of the disease should not be used for beeading purposes.

The desease should not be used for beeading purposes.

The average poultrykeeper may not be able to determine whether all his fowls are free from white diarrhoea or not. Nevetheless, it is a safe course to for the production of hatching eggs only the healthlest and most vigorous hens.

As a mere matter of successful into the close of the fact where all his fowls are free from white diarrhoea or not. Nevetheless, it is a safe course to for the production of hatching to remain unchanged until they reach that part of the digestive tract called the duodenum. Here the spores escape from the cyst and attach themselves to fite commands the production of hatching two hatching

days. Disease Spreads Rapidly.

the disease by external means. The droppings of affected chicks are the droppings of affected chicks are the chief source of contaminating soil. food and water. By this means the grass on an open poultry run, or the soil of a pen or yard, is easily contaminated. When the droppings become dry they crumble and are blown from place to place by the wind. Infected dust containing spores is deposited on the food plants of chickens or mature hens, and thus they become diseased. If the spores drop into the food or water where younger chicks are kept, outbreaks of the disease will occur among them. Forty days of exposure of white them. Forty days of exposure of white diarrhea spores in water does not destroy them. Since young chicks are more susceptible to the disease than

more susceptible to the disease than more mature birds, protection of food and water against contamination becomes of the greatest importance. Infection is spread by older fowls one to the other, mainly by coming in contact with infected droppings. Birds, such as pigeons or aparrows, eat contaminated food, but the parasites pass woman to be a serious candidate for the nonination of Vice-President. She was tried and put to death.

After this time the deaths are not so apparently injures the hatchability frequent. The chicks with stronger vitality may recover. But, as a rule, growth. If they are females, they often continue to harbor the disease and they placed therein. become a constant source of infection. These birds are called "chronics." They

There may be no prominent symptoms of white diarrhea, except weakness and lack of vitality, if death occurs within a few days after the chicks are hatched. When the disease becomes pronounced the victims soon become listless, sleepy, and sometimes droop their wings. If they are incubator chicks, they will haddle together under the hover; if they are with a mother hen, they want to be brooded most of the time. They lose appetite and do not eat much.

In severe cases the chicks stand disease sets up. Milk contains a quantity of sugar which is acted upon by certain fermentation organisms. These certain fermentation organisms, These white diarrhea. The feeding of sour milk is an important agent in lessenting the diarrhea. On account of the ravages of white diarrhea, expecially during the first few days of life of baby chicks, it is important to begin feeding sour milk should be constantly kept before the Symptoms of the Disease Plain.

In such cases the discharge from the vent may re slight or abundant, in color white or creamy, and sometimes mixed with brown. This discharge frequently sticks to the down and may even stop up the vent. During this stage of the disease, the chick may die suddenly, even while apparently still strong. But if the disease is prolonged, the victims gradually grow thinner and weaker until they succumb. With few exceptions,

for the developing embryo during incu-bation, many chicks have the disease when hatched. But this is not the only danger. White diarrhea is easily roosting places and scratching pens transmitted to well chicks in various should be kept as sanitary as possible ways, which can be clearly understood by studying the organism which causes the disease.

Cause of White Diarrhea Noted.

nue of infection is checked. Yards and be had made the hens understand that they must earn their rations or there would be none.

Last Saturday, the family commissary department being short of meat, the flock as the primary source of contact of the policy out two hens who were not doing places.

Cause of White Diarrhea Noted.

A minute animal parasite is the cause of white diarrhea. This organism lives and multiplies within the intestines of young chicks. The physiological effect of the parasite is to destroy the cells in the food passage where the main digestive processes are carried on.

In one stage of its growth the parasite is growth the parasite is passed from the diseased chick within its droppings. Thus the soil of first becomes affected. Then, if the last contaminates either the food or the water, so that the spores of the parasite is the cause of weakness or the least signs of the disease should not be used to be a passed for purposes.

The best protection against white diarrhoea is to breed only from sound stock. Violation of this principle has frequently brought financial ruin to producers of eggs for incubation. For the complete eradication of this disease from poultry farms, stock which gives evidence of weakness or the least signs of the disease should not be used for breeding purposes.

nore careful selection of breeding hens. f this precaution is not taken, white Infection from chick to chick usually diarrhoea may become so firmly established place during the first three or lished in the flock and its surroundings four days of their life. This is the as to render all future efforts to commost critical period for the spread of trol the disease of little or no avail.

Every precaution should also be tak en to protect breeding stock from in

of the baby chick business, and the unlimited possibilities for large or small poultry plants, A------

ouses and yards; they should receive wholesome food and the best of care and management. By no means should they be permitted to come in contact with infected chicks. Unless one is absolutely certain as to

solution of creolin and water. They may be placed in the incubator imme-

necessary to take the best precau-one against it.

Both of these methods have proved During the first week of infection the During the distribution is most fatal. the eggs. Where an incubator is used, the precaution should be taken to disinfect the inside of the machine every time it is used and before the eggs are

Sour Milk Antidote.

These birds are called "chronics." They spread the disease to chicks they may hatch and rear, and constitute a dantach and rear to older fowls when replaced in the yards.

The feeding of sour milk to chicks appears to be an easy means of controlling white diarrhoes. The purpose of sour milk is to suppress intestinal putrefaction, which the parasite of this disease sets up. Milk contains a quan-

around with eyes closed. They become chicks until the dangerous period of indifferent to everything around them except that many will chirp constantly as if cold or in distress. Frequently, when chicks try to void excrement, they will utter a shrill, painful twitter, the breathing is labored, and they gasp for breath.

In such cases the discharge from the

ARCHDEACON DEFIES COLD

'Yes, I Climbed Mount McKinley," Replies Alaskan Worker.

CHICAGO, Ill., March 24 .- The Chicago clergyman who considers his lot hard when the church furnace back-fires, the church roof leaks and the congregation blushes apologetically as the collection plate passes should spend a half hour with Archdeacon Hudson Stuck, of Alaska. Archdeacon Stuck has a wealth of tolerance for disgruntled divines and agitated reformers. Even the primaries didn't move the archdeacon. In Alaska, where Dr. the archdeacon. In Alaska, where Dr. Stuck spreads the gospel, he uses a team of dogs as adjutant evangels and a sled as a flying altar. Dr. Stuck climbs mountains, shoots rapids and acales icebergs every time he has an important sermon to deliver. Last year Dr. Stuck traveled 2000 icy miles with

his dogs, administering sermons to his "parish."
"I'm in the States to participate during Lent in the work of the Church Club of Chicago," he said at the break-

The country is still a frontier land," he said. "The railroads there are still hypothetical. Along the coast live the Eskimes. Inland live the Indians. They are not particularly interested in re-ligion. It is the same with them as with every new land. The difficulties in spreading the gospel through the Yukon country have had something to do with it perhaps. One gets used to the difficulties and a 100-mile trip with team of dogs in subzero weath omes as commonplace as a five-mile or stock was asked to recite briefly his experiences in climbing Mount Me-Kinley, the tallest peak in America. This is the way he described it:

"I climbed it."

The archdeacon, after finishing a typical Yukon breakfast—two soft-boiled eggs and toast, not seal blubber and gumdrops—departed for St. Louis.
