Airplane Device to Aid in Long-Distance Flights.

Invention Designed to Make Possible Taking of Fuel in Motion.

PARIS, Jan. 7.—An invention recently perfected by Godfrey Cabot of Cambridge, Mass., the American delegate, designed to make possible the taking up of fuel by an airplane in motion, aroused great interest at the first congress on aerial navigation held here.

Transatlantic air travel would be greatly facilitated by this method, as stops at "airmen's islands" would not be necessary at intervals in the Atlantic ocean and airplanes would have much additional space available for passengers and mail which otherwise would be taken up by fuel sufficient for one crossing.

Mr. Cabot thinks that trans-Atlantic air navigation will be a paying proposition within 15 years provided airplanes do not carry fuel enough for an entire trip. With a minimum of fuel and a maximum of space for mail and passengers it could be made a successful enterprise, Mr. Cabot said. He assumed that ocean crossings would be quite ordinary occurrences within a few years.
