Control of Thistles to be Demonstrated

Applying sodium chlorate as a control for Canadian thistles will be demonstrated by L. E. Francis, assistant county agent on the farm of R. H. Kincheol at Hazledale at 2 o'clock Thursday. Now is the proper time to apply chlorate to thistle patches, reports Francis. Applications of the dry chlorate at the rate of three to five pounds per square rod in the late fall allows the winter rains to properly carry the chemical to the roots of the thistles. This treatment, followed by a treatment in the spring where the thistles have been missed, has proved to be every successful in many localities. It is declared. Control by this method costs approximately 50 cents per square rod.

THE PRINTING DOLLAR

Who gets the dollar that is spent for printing? Analysis of disposition of the dollar spent for printing shows that more than 70 per cent of it is paid for labor and remains at home to benefit the printer, the baker, the clothier and every line of retail trade.

The dollar expended with the local printer is of greater value to the community than the dollar spent for merchandise.

The local merchant who buys printing outside of his own community is robbing his own cash register. A good many retail merchants need education along this line. The only source from which they will get this education is the local newspaper.

It has taken years for people to come to some understanding of the fact that the tourist dollar, for instance, is of direct benefit to the entire community.

The dollar spent for printing is the most loyal dollar in your community. Don't let your local merchants forget that fact.—Minnesota Press.
