How to Kill Green Bugs in Rosebushes

Many rose growers are bothered by green bugs in their rosebushes. These bugs are sold in the market for feeding to birds which will destroy them. Some gardeners have been known to place the rosebushes in a rubber room and spray them with water in order to kill them. A simpler way is to kill them by placing green grass in the bottom of a rubber room and placing the rosebushes in the room so that the water from the bugs will fall on them. This will kill them in a short time.

Weeds, their Identification, and their Control

Every garden should be free from weeds. The following is a list of weeds and their identification:

1. Dandelion: This is a small, yellow flower with a long stem. It is found in gardens and fields.
2. Thistle: This is a large, purple flower with a long stem. It is found in fields and pastures.
3. Ragweed: This is a small, white flower with a long stem. It is found in fields and along roadsides.
4. Mustard: This is a small, yellow flower with a long stem. It is found in fields and along roadsides.

Weeds can be controlled by hoeing, digging, and spraying with weed killers. A good spray is one that contains sulfuric acid and water. The spray should be applied to the weeds when they are young. If the weeds are not killed by the spray, they will grow again and must be killed by hoeing or digging.

How to Build a Garden Fence

Building a garden fence is a simple task. The following is a list of materials and instructions:

Materials:

1. Posts: These can be made of wood or metal. They should be 4 feet tall and 2 inches wide.
2. Crossbars: These should be 2 inches wide and ½ inch thick.
3. Nails: These should be 3 inches long.

Instructions:

1. Drive the posts into the ground at intervals of 20 feet. They should be driven about 1 foot into the ground.
2. Attach the crossbars to the posts with nails. They should be attached at intervals of 2 feet.
3. The fence should be 4 feet high.
