There are several reasons why this [Mill should be preferred to all others :

1st. It is far more durable because it is all

2d. It is Cheaper because of its simplicity and durability, and will outlast several Wooden Mills. 3d. It is Less Complicated, because there is only three pieces of operating machinery.

4th. It is more powerful than any other Mill, on account of the thin fan, and consequent in-creased suction of air, and because it is operated by an eccentric, being far superior to the crank shaft or rest pin, as a lifting and falling power.

5th. It needs no care, no watching, having self-feeding oil caps and self-regulating vanes. It regulates, protects and takes care of itself. 6th. It never warps, shrinks, or swells, hence it is not liable to get out of order. Once up, R goes all right,

7th. It does more work, runs easier and throws a larger body of water. It will submerge a larger tract of land, with less wind and in a shorter space of time than any other Windmill now in use. It may be set to turn out of the wind at any desired pressure, there being a graduated lever for that
