FARM AND GARDEN

An unusually heavy amount of trading was done in the wholesale line. Busiof the Farmer.

How to Make Delightful Muffins-Los Absorbs the Flavor of Meat, Cucumbers, Etc.

When potatoes are freshly gathered the skin is best rubbed off with salt in a coarse cloth. Wash very clean, and let them remain for about half an hour in salt and water. There are many simple and effective

sugar burned on hot coals, vinegar boiled with myrrh and sprinkled on the floor of the sick room. Rice is the least nitrogenous of all grains. It is a good addition to bread, and is especially serviceable to combine with highly nitrogenous foods, such as peas, beans and lentils. It is particu-larly adapted to invalids, as it is one of

most easily digested substances known. To cool your face and prevent an oily appearance put a few drops of aromatic ammonia in your morning bath. When the face becomes overheated and "shiny" during the day, wet a corner of a towel

The most delightful muffins are made from the fine flour ground from the whole wheat. This is a dark flour. It differs from Graham in that the bran mixed through the Graham gives a coarse texture to any bread made from it. The fine part of Graham flour is coarse like a meal. Entire wheat flour, on the contrary, is as fine as any bolted flour, all parts of the kernel being powdered. The brown bread and murfins made from it have the sweet, nutty flavor of the kernel.

Do not lay meat, fish, cucumbers o anything else directly on the ice, as it absorbs flavors readily and will impart them to the drinking water. The com-partment for ice should be so constructed that no food will come in contact with it, The refrigerators should be kept entirely for milk, butter and water, though sealed and air-tight cans even of salmon, lobster, ham, etc., may be kept in the upper part without spoiling the butter or milk, and of course without affecting the water, unless one should be stupid enough to put them in the water tank.

Flowers should be gathered early in the morning wille wet with dew or late in the evening after sundown. It is better for the plant and for the flowers cut that they be removed by scissors or a sharp knife than wrenched off with the hand. It is far better if they are kept for some time to change the water daily

and clip the ends of the stems each time. Rare roses and valuable flowers should be covered with paper and set in the ice box at night. A few drops of ammonia or a little salt in the water is said to materially assist in keeping flowers fresh. It is not everybody who can make a bed well. Beds should be stripped of all belongings and left to air thoroughly. Don't, however, leave a window open directly upon the bed and linen, with a fog or rain prevailing outside. It is uncommon to

Bears-Small white, 334c; pink, 334 bedding hanging out of a window with perhaps rain not actually falling, but with 90 per cent, of humidity in the atmosphere, and the person sleeping in that bed at night wonders the next day where he got his cold. A room may be aired in moist weather, but the bed ling and bed must not absorb any dampness.

> Ashes as a Fertilizer. The value of ashes depends, of course, largely on the composition of the burned substance that produces them. They may contain more or less of potash or

of wood that is burned. Wood ashes are generally valued according to the amount of potash they contain, but the end to be aimed at.

"Then the pace and the breathing must, other fruits, and all fruit-tree woods have more phosphates than woods from forest trees. Burned bones have their chief value in the phosphate they contain, but burned bone, unless it is dissolved by sulphuric or carbonic seid, is not available as plant food. Caustic potash has, however, some power to make other mineral plant food available, probably by its effect in making it ferment and liberating carbonic-acid gas. Leached ashes after long exposure to the air absorb ammonia, and thus make

their potash was leached out of them.

them often a better fertilizer than before

Wool-Growing and Climate. Wool is emphatically a product o Northern climates, as cotton tropics. There is especial adaptation of product to the need of the people inhabiting these respective regions in this provision of nature for the products respectively produced by each. It is impossible to grow cotton in Northern localities, because the season is not long enough. There is equal disability in Southern localities to produce the best qualities of wool. This is shown by the demand from Australia, a semi-tropical country, for the American Merino rams bred by Vermont and Western New York breeders. Years ago Australian woolgrowers thought by crossing with Americanbred sheep they could make their flocks all that was needed to produce good wool. For a time they succeeded; but of late years a renewed demand has come for the American-bred Merinos to improve still further the native stock, which under the influence of climate shows a constant tendency toward deterioration.

Plant Strawberries Early. There is no need to allow the new plant on strawberry runners to attain large growth before transplanting it. In fact, the smaller the set the surer it is to live, and the quicker it will begin to develop fruit bods for another year. early-set strawberries require a good deal more work to keen them free from runners, but they well repay extra trouble.

Had a Portion. "Haven't you got any flies to this stage?" asked the low comedian of the stage manager. "Well, no," said the theatrical manager.

wake me up as you usually do.

TESTING DRINKING WATER.

Unsatisfactory Results Which Are Some times Obtained-Remarkable Tests. We are giving more and more attention to the purity of drinking water as it becomes more apparent that infection of almost every kind travels by water. It becomes of the highest importance to know whether the tests usually respected to for whether the tests usually resorted to for the detection of organic impurities are trustworthy. If dangerous impurities slip past these tests, they afford no protection against the transmission of disease germs. The Sanitarian prints a pa-per by Dr. J. A. Tanner, of Boston, giving

results of some of his experiments in this direction, which may almost be called

Dr. Tanner declares boldly that the chemical processes relied upon for testing water are "as apt to condemn a good water as they are to commend it, and to commend an impure water when they should condemn it," and his statements go far to support his theory. For example, if 5 per cent. of milk or any beef extract be added to a gallon of distilled water the processes will condemn it as impure be-cause it contains organic matter. Add a ew million of disease germs to a gallon of distilled water and none of the processes will discover them, because the quantity of organic matter is not large enough. Yet the one mixture is entirely enough. Yet the one mixture is entirely harmless, and the other, if we accept the gern theory, is dangerous. The combus-tion process relies upon the proportions found of carbon and nitrogen; the ammonia process upon the presence of free ammonia and albumoid ammonia; the permanganate process upon the amount of oxygen required to oxidize the organic matter. All of these tests are extremely delicate, and a slight inaccuracy is enough to cause an impure water to be rated as

The fact that they disagree wildly in their results with the same water is enough to shake faith in all of them. Dr. Tanner shows this by reference to the investigation conducted by Professor J. Mallet for the national board of health some years ago, with which he was connected. Nineteen samples of natural water, believed from actual use to be wholesome, were examined by these processes. They agreed that ten were potable and three were not, but as to six, or one-third of the number, they disagreed totally. Then nineteen samples were taken of "natural waters which thore seemed to be fair grounds for believing have actually caused disease." But only four of these were rejected as unwholesome; as to nine, or one-half, there was no agreement, and six, or one-third, were pronounced wholesome by all the processes. Then twenty samples were taken of natural water of doubtful but sus-pected character, and as to these the results were really more unfavorable than

pure, or the opposite.

as to the waters known to be dangerous. The most remarkable of all the tests were with twenty samples of good water, to which were added various pollutions, such as sewage from various sources, black vomit and like offensive and poison ous substances. Only eight of these samples, less than half, were condemned by all the processes; as to nine the reports did not agree, and three the processes actually concurred in pronouncing good. Water, to which enough of a weak mixed sewage from a large public sewer had been added to create, it was believed, had been added to create, it was denoved, serious danger of typhoid, was pronounced to be of "great organic purity" by two processes, and "good" by the third. A larger admixture of the same sewage, as much as 5 per cent. was pronounced of the same is the same sewage. "medium" quality by two processes, and "bad" by only one. Even more striking examples could be given. Yet the same processes condemned as impure the Lake Drummond water from the Dismal swamp, which is in part the water supply of Portsmouth, Va., and the Cochitu-ate of Boston, simply because of the presence of vegetable matter contributed by leaves, roots, etc.-New York Tribune.

Mountain Climbing for Invalids. Oertel has extended his advocacy of

mountain climbing, as a curative agency, to other forms of heart disease beside such as are dependent upon or associated with corpulency—namely, to all forms of "weak heart," and also to valvular defects. For this purpose he prefers re-sorts surrounded by mountains, on the sides of which graduated walks, of increasing difficulty, and extending up to between three thousand and four thousand feet can be mapped out. "It is by no means a matter of indifference how you walk up these ascents. It is to be done in a strictly prescribed manner The hills are to be ascended slowly, and phosphate of lime, according to the kind the pace must be as even as possible, with no talking and no interruptions.

amounts of phosphate of time, and are there ore more valuable. Pear-tree wood and trimmings of grape vines are said to tion and with the next an expiration; contain more phosphates than woods of both acts should be equal and regular in length, neither longer nor shorter than the step. One foot is raised with the beginning of the inspiration and put down as it ends: the other foot makes its step in the same manner, with the expiration These precautions must be minutely observed, or palpitation and difficulty of breathing will be induced. The patient may lean on a stick, but he must not pause often in his walk; but he may rest for half an hour or an hour after the completion of one of the appointed tasks The cure will be slow and gradual, re quiring great patience; it should last from four to six weeks, and it may have to be repeated several times in the year."— Home Journal.

The Czar Chopping Wood.

The yachting party of the czar and his family has been quite an idyl. The imperial party picnicked on an island; a boat was filled with provisions and all requirements for a good lunch, but no attend-ants were allowed to land, the czar and ants were allowed to land, the his family having resolved to enjoy themselves al fresco and all alone. And they actually laid the cloth, lighted the fire and cooked the fish and made the tea them-

It must have been a grand sight to see the autocrat of all the Russias with his coat off, making up the fire. He owned afterward to having grown very tired over chopping the wood and being on his knees trying to make it burn up; the princesses came and had a blow at it, now and again. to encourage him, and the czarina busied herself meanwhile cutting the bread. Ah! how good it must have tasted, that luncheon on a little island all to themselves, and far from the din of a court, the strife of politics, the fear of conspiracies; and how loth the parents and children alike must have been to leave it and realize that their summer holiday was nearly over!-London Modern Society.
