Diphtheria.

Symptoms—It begins usually like an ordinary sore throat, with redness and sometimes swelling of the arches of the palate, and of the tonsils. There is a slight stiffness of the neck, and the glands at the angles of the jaw are enlarged and tender. Within a period varying from a few hours to a few days, an exudation takes place on the tonsils, uvula and soft palate. This exudation is more or less extensive, generally tough, and of a white or grayish hue. It may show but little tendency to spread, or it may extend to the gums and along the walls of the pharynx and into the windpipe. In some cases it passes upward into the nares, (where the throat and nose unite) yet it may commence there simultaneously with its appearance in the throat. The false membrane once formed darkens, wastes from circumference towards the center and gradually disappears. But sometimes the coat becomes for a time thicker and thicker, by the constant addition of fresh layers. There is generally but little fever accompanying it, but the patient will complain of weakness—"tired" as they generally express it. Many will not even complain of their throat as being sore. The disease is undoubtedly one of the blood, the exudation is the effect of the disease. When the exudation is extensive the system may become secondarily affected by the re-absorption of matter.
