Where Fowls Are Confined In Summer.

(By MILLER PURVIS.) I regard green feeds as absolutely old and young, both summer and winter. Where fowls are kept confined it must be supplied to them and where they have full liberty it may be fed to them with profit during the months when vegetation is somewhat burned by the heat.

A letter from a friend exactly coin-He says his hens ate this rape as greedily as they would if they had not been shut up where they could not be out to find grass for themselves. have noticed this more than once.

Throw out a lot of fresh lettuce they will eat it up clean. Cabbage stumps thrown out to the hens will be picked clean, even where the hens run at large.

Those who must keep their hens confined will find that a small plat of rape will furnish a large quantity of green feed during the summer.

It will be large enough to begin cutting in five or six weeks and as soon as it is cut off will throw up new over time after time.

Lettuce or dandelions make a very good green feed for laying hens or growing chicks. There seems to be some medicinal property about both these vegetables which promotes good health in the fowls.

Both are easily grown and furnish a good supply of feed if the tops are cut off instead of pulling the plants out by the roots when gathering the
