The science of agriculture is a difficult one. On the one hand, it is a science that is developing rapidly and is making great strides in building a better world. But on the other hand, it is a science that is full of problems and challenges. The farmer, in particular, is faced with a number of difficult decisions. He must decide what crops to plant, how much land to cultivate, and how to best use his resources. He must also be aware of the changing climate and the need to adapt his farming practices accordingly.

However, agriculture is not just about crops and crops. It is also about people. The farmer is not alone in his endeavors. He has support from his family, his neighbors, and his community. He also has access to a wealth of information and resources, from government agencies to universities.

In the end, the success of agriculture depends on the farmer's ability to adapt to the changing environment and to find new and innovative ways to improve his practices. This will require a great deal of hard work and dedication, but it is also an exciting and rewarding field for those who are committed to it.
