# Why Lovers CAN'T HELP Quarreling

HE psychologists have been making a special study of jealousy. According to their latest definition, jealousy is just love with the engine

If you tell a lover that he is jealous because he has, so to speak, reversed his engine of love, he will think you are joshing him; but that, according to the latest scientific research, is just his complaint.

Jealousy is pain, while love is pleasure, but both impulses are governed by the same brain centres. These brain centres work violently on the heart through the vagus nerve, and, if long continued, jealousy may upset the entire nervous system and, through it, all of the bodily functions, reaching even to the stomach and the processes of digestion.

What is termed love is accounted for upon psychological grounds by the action of these same brain centres, acting sometimes as an excitant upon the vagus nerve, but when satisfied and gratified has a soothing influence upon the heart through the same

It is not easy to explain the association centres, for they are so complex in their action that they have not been fully explored and explained. We know that JEALOUSY Is Simply LOVE with the Engine REVERSED

the centres of touch are at the top of the brain, and those of smell and taste at the base of the cerebrum. We are certain that often these centres act together, especialy where the emotion is very powerful. They are stirred through the eye, the ear of touch.

When you see the person you love or hear his voice or even see his picture there is an excitement of these associative powers, and often a desire to touch the beloved. This is gratified by touching the hands or lips, or even touching the clothing may suf-

fice. The excitement often manifests itself by the act of blushing, which is only the action of the vagus nerve upon the heart, sending volumes of blood to the surface of the face especially, and so gorging the blood vessels that the skin turns red. Some become pale under excitement, owing to the tightening of the capillaries, preventing the blood from show-

These are the explanations which the physicist gives of the accompanying phenomena of love, for he is not concerned with, nor can he ever explain, causes. Why these centres act as they do, none can say, but after many ages of observation certain signs have been set down as indicative of affection or of jealousy.

Jealousy is, however, so complex a feeling that it is not easy to explain the process by which it is attained. Its source is the association centres of the brain, and sight or sound are only the excitants of a

state of mind, or excitement, quite the reverse of love. Love must be present for jealousy to arise. If the lover sees the beloved in the company of a rival, or be told somehting tending to show that another is preferred to him or her, jealousy is at once evoked. It is one of the most powerful motives that can be aroused in a human being, and may go even so far as to bring about a murder, as in the case of Othello and Desdemona, an act repeated thousands of times since from a similar

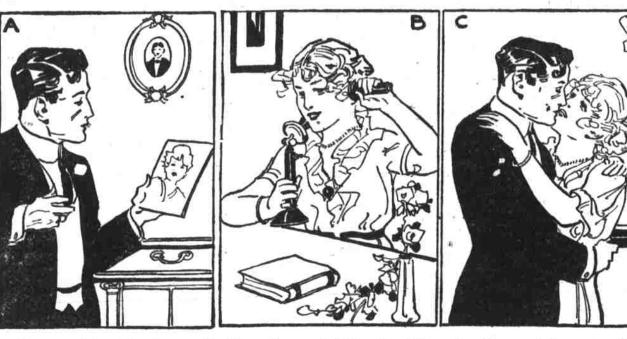

The engine of love may still be progressing under full steam; in fact icalousy has been known to raise love itself to fever heat. The flirt tries to make her lover propose by showing him how attentive others are and arousing his jealousy. The psychologists recognize the powerful play of jealousy and show how it

perverts the judgment and magnifies trifles which to others mean little or nothing. To the jealous man a look may mean preference of his rival, whereas it may have been the most innocent possible.

It is because of this overbalancing and perverting of the judgment that it is well to understand how jealousy works, thus safeguarding men and women from useless, often silly, suffering, because of the blindness or magnifying power of the hatred of the rival. Just as love itself magnifies every virtue and sees beauty where the unmoved person sees nothing especially attractive, so jealousy takes the one whom it possesses to the wildest extremes, because of the over-activity of the emotional centres, preventing him or her from seeing the truth or listening to reason.

It has been held that those who really love deeply are incapable of jealousy, because of complete confidence based upon a full appreciation of the qualities of steadfastness in the other. But if in any way this confidence is shaken by the whisper of gossip or the observation of something that seems to be a breach of love jealousy steps in with a violence in proportion to the love perviously experienced. This is the reason that psychologists speak of jealousy as a reversing of the engine of love, because, while the lover asserts and reasserts his affection, to others it seems as if love has become hatred, not only of the rival, but of the primary object of love.

Confidence in the object of one's love is to be encouraged. The greater the confidence the less likelihood of jealousy. Most jealousy proves to be groundless, and the moral which recent psychological research seems to point is that the lover should theroughly investigate the grounds for his jealousy before allowing it to run away with him.

"The mere sight of her photograph (A), or the sound of his voice (B), excites the association centres in the lover's brain and creates a desire to touch the loved one (C) with lips or hand."

## Microbe That EATS METAL

LTHOUGH science knows a hundred micro-organisms · that devour the human tissues and cause all sorts of maladies, and also many that eat plants, present the iron is precipitated by the germs rocts, dirt, wood and clething, it has never as iron bog-ore, while in the absence of oxybeen imagined that there was one capable of eating up bits of steel and iron. Yet the discovery just made by E. M. Mumford, an English student, shows that this is the case.

A bacillus that has a specific action upon solutions of iron and steel was obtained by Mr. Mumford from the Bridgewater canal tunnels at Worsley, Lancashire, England.

This new species of bacillus varies in its germ itself does.

digestive action upon iron and steel compounds according to whether it acts in the presence or absence of air. When oxygen is gen no iron salts are formed.

This iron eating germ is a short microbe about one-thousandth of an inch long. It grows readily on potatoes and then looks greenish brown in color. It also colonizes in milk, gelatin and agar.

It also forms an iron digestive juice or enzyme, which acts upon iron just as the

## How the COCKROACH May Be the CAUSE of CANCER

TY/E have heard so much about the dangerous house-fly that it is quite a relief to have the blame for some of the ills that afflict mankind shifted from the shoulders of the fly to the broad back of the disgusting cockroach.

In a recent issue of The Lancet, Dr. W. Melville Davison calls attention to the fact that the cause of cancer may be an alga which is found in the bowels of several varieties of cockroaches.

By a curious coincidence, the United States Agricultural Department has recently succeeded in isolating a vegetable parasite which causes plant cancer, and which carries the disease from plant to plant, and Professor Vibinger, of Copenhagen, has discovered a

worm which flourishes in the house rat, causing cancerous tumors in the rodent it afflicts. The larvae stage of this worm is passed in the intestines of the cockroach, and Professor Vibinger states that he has no doubt that a similar parasite causes human cap-

Of course these suppositions are based on the assumption that cancer is a germ disease and not a dietetic disease, as an eminent authority stated only a few years ago in The Lancet. It was believed that excessive beef eating causes cancer, and it was pointed out that the British, who are the greatest beef eaters in the world, show the greatest percentage of cancer

It is well, at any rate, to be on the safe side, and to exterminate the cockroaches as ruthlessly, or more so, than the fly. No food on which a cockroach had place, all left-overs should be carefully covered to kepp the reaches from touching the food.

The Lancet, of course, recommends that roaches should be starved and not poisoned. Scrupulous cleanliness will do much toward ridding a house of roaches. A bread crumb that has dropped to the floor unperceived, a bit of jam that has splashed on the kitchen oilcloth and has not been wiped away, immediately, will attract this loathsome plague.

Roaches are often carried into the kitchen in bundles of wood, and it is well, where wood is still used. to shake each bundle thoroughly before bringing it into the house. A good many housewives are using charcoal instead of wood to kindle their fires for this
