NATURAL GAS AS A MEDIUM

The discovery of natural gas in Canada has been followed by another discovery, the development of a new and efficient machine for its extraction. This machine, known as the 'steam engine,' is said to be capable of producing a considerable amount of gas in a short time.

The engine consists of a large cylinder, connected to a series of pipes, through which the gas is forced. The cylinder is filled with water, and the pressure of the steam is sufficient to force the gas into the pipes. The gas is then collected in a tank, where it is ready for use.

The advantages of this method of gas production are many. It is much cheaper than the former method, which involved the use of fire and charcoal. It is also much more efficient, as it can produce a large amount of gas in a short time.

The steam engine has already been tried in several places, and has proved to be a great success. It is now being adopted in many other places, and is expected to revolutionize the gas industry.
