

OUR POULTRY INDUSTRY BOOM MAY BE HELPED BY PERMANENT BUILDINGS

Good Birds and Intelligent Care are Not the Only Essentials to Successful Poultry Raising; Suitable Houses are of Equal Importance

Now that our poultry industry boom in the Salem district is fairly going, with prospects of increasing indefinitely, it is the duty and should be the pleasure of every one here who is interested in his city or his country to give it a boost in all possible way.

poultry house is, it is not a real hen home unless it is kept clean. Disease and vermin thrive in filth. Plan the house so that it will be easy to clean. Put in a good floor, have a dropping board, hinged roosts, and nests that are easily cleaned. Make sure there are no cracks or crevices to afford hiding places for mites.

more sensitive to drafts than farm animals. Nothing induces colds, roup, and other respiratory diseases so quickly as drafts striking the hens while they are inactive on the roosts.

The semi-monitor type of poultry house is very popular with many farm poultry raisers. It is tightly enclosed on the ends and back side and has an open south front. A house of this type 24 feet wide and 30 feet long will furnish sufficient room for 200 to 250 birds. If a larger house is desired another section may be added. The super-structure is supported on posts set on concrete footing. The walls of the building may be of two materials—brick or hollow building tile.

The extra eggs are our margin of profit; they make up the difference between profit here and loss elsewhere; or between big profits here and small profits in other sections. And there are other manifold advantages, too numerous to mention.

ter egg producer than red pepper. Not many disease germs can develop in a dry sunny house. Hens require from two and one-half to three times as much air per pound of weight as horses, cows, or other farm animals. This is because they maintain a high temperature—106 to 108 degrees. It takes air and food to keep up this high temperature.

warm. The larger part is available for the production of an increased egg yield, and for the maintenance of a vigorous, heavy stock. Furthermore, the impervious walls of hollow building tile do not allow a lodging place for the parasites which prey upon poultry and interfere materially with the egg yield.

keep the house dry and comfortable. Build the house deep enough so the roosts will not be too close to the open windows. Build it low enough in the rear so the body heat of the hens will help to keep the space above the roosts warm. Unbleached muslin or burlap curtains at the windows are necessary for zero weather.

Where the Profits Are Two hundred and thirty hens that averaged 72 eggs per year made a profit of only \$61; 200 hens that averaged 124 eggs per year made a profit of \$373.
