THE OREGON STATESMAN, SALEM, OREGON

President of Audubon Society Gives Lecture

Opening Meeting for Salem Nature Study Club Held; Many Pictures Shown by W. A. Elliott During His Interesting Address

The Salem Nature club, one of the most significant of Sent organizations, held a particularly successful open meeting on Friday evening, March 11, at YMCA.

W. A. Elliott president of the state Audubon society spoke on birds of the Pacific Coast. Mr. Elliott exhibited more than

Bluebirds, harbingers of spring, are already seen perching on low boughs and fence posts.

75 colored plates and spoke to a packed house for a period of more than two hours on the habits of western birds.

Mr. Elliott is one of the outstanding authorities of the country on bird life. His book, entitled "Birds of the Pacific Coast." is known to many people in Salem and can be secured ing operations. through the local book stores.

through the efforts of C. A. Kells, and George Shand. These men called a general meeting at the YMCA on February 19 at which time the club was formally organized. The constitution provides for a governing board of ten members. At the present time there

will be named later; The following are the officers and chaster members of the club, which is open to those interested:

Mr. George Shand, president; Prof. M. E. Peck, vice president; Mrs. C. A. Kells, secretary-treasurer: Robert Paulus, Miss Mirpah Blair, Mrs. M. E. Peck, Miss Lillian Applegate, Miss Gussie A. Niles, Loyal &, Warner, Dwight T. Shaw, Robert Dann, Mrs. Robert Paulus, Prof. H. C. Kohler, Miss Clara E. Smith, Mr. and Mrs. Henry C. Gilbert, Miss Elaine Brown, Leonard Mosher, Mr. and Mrs. Walter H. Denton, Miss Elsie S. Devine, Miss Clara E. Stewart, Mrs. E. M. Hoffnell, Mr. H. C. Batchem, Mr. C. Kells, Mary Elizabeth, Margaret Ann, and Frances Alice Kells, Mr. and Mrs.

Salem Nature Study club was realized as an organization protection of birds at that time started by him attained a membership of 48,868. It was later discontinued, but the name and purpose remained in memory of John James Audubon, a distinguished American ornithologist, born in 1780 in Louisiana. John James Audubon, born of

French parents, was educated in Paris. Upon leaving school in France he returned to America where he occupied himself with his ornithological studies. He spent much time in watching the habits of birds. Often he took long walks through the forest regions of uninhabited sections of our early country, sometimes being gone for months upon such journeys, in the course of which he perfected many sketches of birds.

With a mass of data on bird life accumulated in 15 years of such excursions, he proceeded to Philadelphia to publish a work on birds of North America. While he was absent from the city, all this, then all political parties his papers were destroyed by rats, hence forth must epouse the tariff

Hull, Miss Eleanor Lzicar, Mrs. P. M. Hester, Mrs. S. H. Van Trump, Mr. Ben Rickli. The first eight members comprise the board of directors.

The speaker on Friday, William Ayres Eliot, as president of the Oregon Audubon Society is, of course, deeply interested in the protection of the birds.

The Audubon society is an organization of bird lovers who work to educate public opinion to a proper appreciation and protection of bird life and to cultivate in them a love of birds, to communicate knowledge of and enthusiasm for them to others.

The term Audubon society was coined by George Bird Grinnell in 1865, and an organization for the Miss Mirpah Blahr.

GIRLS SCHOOL IDEA GETS DEATH KNELL (Continued from page 1.)

calling the normal a girls' school are numbered. The offices of responsibility now held by the men are justly earned, and with continued cooperation between the normal school is indeed bright. Among the many organizations

in the school the men's club is one of the most influential, and under the administration of the present officers it has become a noticable factor in all campus activities. The policy of this club is to work for the general good of the school, promote better fellowship and raise the social standards among the men, and encourage a larger enrollment of men from all parts of the state. During the past year it has been instrumental in organizing the pep committee, athletic contests, "smokers' wrestling and boxing with matches, and fostering the basketball tournament. Outstanding among athletic events, was the winning of the 1927 championship in the Willamette valley conference by the basketball team and much credit is due the men's organizations for their support and encouragement. Socially the men's club is ginving a banquet to the men of the football team

and a like affair for the basketball squad. Plans are now under way for a formal dance which will be the most prominent social event of the winter. The men of the school were well represented on the honor roll of the fall term, and are equally represented on the student council-the student gov-

erning body of the school. Other organizations among the men include the men's gies club. the Order of the "O," and the Y. M. C. A. The Better O. N. S. nclude both men and women. Definite plans are being formuated for the annual tennis tournent, track meet and baseball The men's debating team doing some splendid work this

ing. Four years later he took his designs to England, and in 1830 appeared the first volume of "The Birds of America.

Mr. Eliot says that the society is promoted from two view-points. from the sentimental and esthetic view-point and from the economic view-point.

terested in birds as birds, as creatures of beauty, whose existence calls for protection from a purely sympathetic standpoint.

Others are interested in birds because of the work they do in protecting growing thins. These form perhaps the larger class, It is the purpose of the state society to work from both these view-points. The program committe for the

local club includes: Mrs. C. A. Kells, Professor M. E. Peck, and

fertilizers.

in connection with oat hulls.

Worthy of particular attention on the part of southern land owners is the assuredly growing importance of peanut oil. From this oil, hydrogenation, an excellent substitute for lard is obtainable. Hogs take particular delight in rooting out the ungarnered peanuts left in the ground.. Each acre can thus afford nutriment to fatten 30 hogs up to within three weeks of sale when corn, for the present, must be used to bring the

hogs into first class condition. Moreover, we must introduce new crops into various hasts of the country for cultvation. A Chinese see, alcuritis fordii, has recently been planted in central Florida. From this seed we shall obtain tung oil, especially adapted to high grade varnishes, paints and linoleums.

Upon poor southern land we shall grow dasheens and yams which yield such large starch crops, particularly adapted for fermentation.

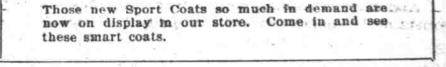

The long-leaf pine is destined to come into prominence by reasen of the new developments in the chemistry of turpentine. From giving another 10 per cent of the the pinene fraction of turpentine synthetic camphor is now produced abroad at such prices as to make it highly competitive with is now manufactured celeotex, a natural camphor. Whereas the remaining portion of the turgentine by careful halogenation and oxidation yields an excellent substitute for the best quality of linseed oll.

Upon poor northern lands, notably in Michigan, Norway spruce will be planted. In 25 years, the spruce will be ready for cutting and shipment to artificial silk plants. With the replacement of young trees for these cut each year, this will give the Michigan farmers something to secure them against failure in other crops. A new waste product in the artificial silk industry is found to possess qualities approaching those of wool; though not so soft to the touch nor of the same warmth, in sarment form, these desirable properties will soon be supplied either by admixture with other organic chemical products or with wool itself.

When we consider the mounting costs attached to the cultivation rubber. The germ residue is an of such well known crops as cotexcellent cattle food. The starch ten. we cannot overlook the possible introduction of the culture granules of the corn are convertible to alundry starch (33 pounds of weeds or such mterial inherentper busel) and already 50,000,000 ly resistant to all ravages of disbushels of corn are diverted into | ease and insects.
