## FLAKE SPECIALIZES ON BLACK MINORCAS

He Has Built Up Large Baby Chick Business With His Pet Stock

One of the best flocks of Black Minorca chickens in the Willamette valley is owned by E. B. Flake, of Flake's Petland on State street. This flock is considered to be the best producing and best looking flock in the valley. Mr. Flake uses this flock for hatching eggs and sells a great number of baby chicks. He says that the Black Minorcas are gradually coming into the best egg laying class of fowls in the country, running a close second to the White Leghorns.

Mr. Flake handles about 200,000 baby chicks a year, mostly going out in the valley to the smaller poultrymen. His retail business is large because of his store on State street, where he can display all kinds of baby chicks and pet stock.

Last year Mr. Flake could not supply the demand for Black Minorca chicks, so he doubled the output this year and is still unable to fill all orders. His business is conducted on the cooperation plan. He contracts to handle the baby chicks produced by some of the best known and reliable hatchery men in the valley. The fowls producing the eggs are products of his hatcheries and in this way he can keep his strain pure by knowing the flocks producing the eggs. While he does a large retail business in Salem and vicinity, he also ships many chicks out of the territory and out of the state.

In addition to baby chicks, Mr. Flake handles pet stock of all kinds. He has imported several species of canary birds and a number of other varieties of songsters. His store resembles a miniature zoo at this time of the year, when he has his cages and pens full of dogs, chickens, parrots, canary birds, baby chicks and other pets.

## DIRT FARMERS STAR IN UNCLE SAM'S MOVIES

(Continued from page 1.)

and What to Do About It," of which 68 prints were made, has been curtailed in circulation because of insufficient funds. Films are sent to county agents in every state, and frequently are leased or purchased by college teachers, and other bona fide institutions or organizations.

Picture dealing with farm problems are yet to be made from Maine to southern California and from Mississippi to the Sawtooth mountains of Idaho. They will make common property of knowledge developed through investigations by the scientific staff of

the department, and acquaint the general public with the methods and significant lines of work now carried on by America's 80-billion dollar agricultural industry.

Almost 10 million persons attended showing of educational films last year, the possibilities of which "are just beginning to be realized," the department says.

## FARMERS' PRODUCTS ON NEW MARKET SOON

(Continued from page 1.)

on amount of space used, and the rate will be very low. In all probability the farmers' market will be situated on the east side of the building, where the large doors can be opened. This will give the farmer a chance to drive his car or truck up in the alley and unload his produce into the rear of his stall. There will be plenty of room in the alley back of the building for the parking of autos and cars, and there is no parking limit.

Many reservations have already been made for space, and the building of the stalls will start in the near future. Some of the farmers have already announced that they have early produce ready for market by the middle of next month.

The dairy bull should be fed enough to keep him in vigorous physical condition, but not too fat. Some breeders feed their regular herd mixture. Ground oats are considered particularly desirable as feed for bulls. Two tested mixtures are: ground corn, 300 pounds; ground oats, 200 pounds; wheat bran, 200 pounds, and linseed meal, 100 pounds; or, ground oats, 300 pounds; wheat bran, 200 pounds; ground corn or barley, 100 pounds; linseed meal, 100 pounds.

Veterinarians admit that it is impossible to tell certainly by a physical examination whether a fowl has tuberculosis. The tuberculin test is necessary. On a farm where both poultry and hogs are raised, it is wise to make sure as to any chicken suspected of being even slightly tubercular. Avian tuberculosis of fowls is readily transmitted to swine.

## THERE IS NO SUBSTITUTE

The Science and Philosophy of Chiropractic bears no real resemblance to the Science and Philosophy of Medicine, or, indeed, any other known Health system. Its practice is so specific in its application to one principle of cause and one form of adjusting it, as to convince a layman of its individuality. Chiropractors assume that in consequence of displaced segments (small bones of the spine) the openings between the vertebrae through which the spinal nerves pass are affected; that in this way the nerves are pinched; and that such pinching is the cause of the majority of all disease. This condition is called subluxation of the vertebrae. To put these small bones back in position the Chiropractor uses nothing but his bare hands. Directly the pinching has been thus relieved the Vital Force is permitted to again flow uninterruptedly and the result is Health, as the effect caused by the pinching disappears because of the absence of the cause. It will pay you to learn more about this great science. See your Chiropractor at once. Remember the Neurocalometer locates nerve pressure. Chiropractic Adjustments remove nerve pressure. Neurocalometer readings by appointment only.

## RUSSELL HATCHERY IS ONE OF LARGEST

Puts Out First Class Product and Maintains Strictly High Standards

One of the largest hatcheries in the state of Oregon is that of the Russell Poultry Yards, situated one mile east of Corvallis. This hatchery has now a capacity of 125,000 eggs, using two giant 36,000 Newton incubators and two dozen smaller machines. The incubators are housed in two large tile buildings measuring 125 by 40 feet each.

A number of Oregon breeders and poultrymen are kept busy supplying hatching eggs exclusively for Russell's Poultry Yards. A considerable premium is paid for these eggs, for they must come up to certain standards as to weight, color, texture of shell and fertility.

Records are kept of the fertility and hatches from each flock. The flock owners are advised concerning the problems in feeding and management in order that the flocks may be kept at their best and the eggs produced of the highest quality. All stock is pure bred and all strains are kept absolutely pure.

On account of the increasing demand for the heavy breeds of chickens the Russells began hatching Reds and Rocks a few seasons

ago and now handle exclusively the hatching eggs and chicks of several of the best known producers of the valley.

The Barred Rock males used this year for the Russell matings were raised by J. J. Van Kleeck and Sons. Van Kleeck's Rocks this year.

came into prominence at the Washington state contest when two of his hens produced 329 and 322 eggs. The higher of the two individuals was first not only in the Washington contest but in all the Washington official United States egg contests.

## McCormick-Deering

### Combined Harvester and Thresher

The No. 8 harvester has proven to be the most satisfactory size on the average farm in the Willamette Valley.

### Note Threshing and Separating Capacity

22-inch cylinder—37-inch separator. Every experienced thresherman will realize the advantage of these measurements.

This machine is the only Combine Thresher used in the Willamette Valley that has been successful in threshing clover.
