# THE VALUE of SOUND DESIGN

### New Ford engine gives outstanding acceleration, speed and power without sacrificing reliability or economy

THE GOOD PERFORMANCE of the Ford car, so apparent on every highway, is due largely to the sound mechanical design of the engine. It has outstanding acceleration, speed and power, yet that is only part of its value to you. Greater still is the fact that it brings you all these features without sacrificing either reliability or economy. That is the reason the Ford car has given such satisfactory service to millions of motorists all over the world and has been chosen by so many large companies that keep accurate cost figures. In every detail of construction it has been carefully planned and made for the work it has to do. The design of the compression chamber is an important factor in the efficiency of the Ford engine. It

is built to allow free passage of gases through the valves and to thoroughly mix the fuel by producing turbulence within the cylinders during compression. The spark thus flashes quickly through the whole fuel charge, resulting in quieter and more effective engine performance. Other factors are the direct gravity gasoline feed, the specially designed carburetor, the new hot-spot manifold, aluminum pistons, chrome silicon alloy valves of larger diameter, statically and dynamically balanced crankshaft and flywheel, simplicity of the electrical, cooling, lubrication, and fuel systems and accuracy in manufacturing.
